# ACE2 – what is it? Why do we care?

## Renin-angiotensin system

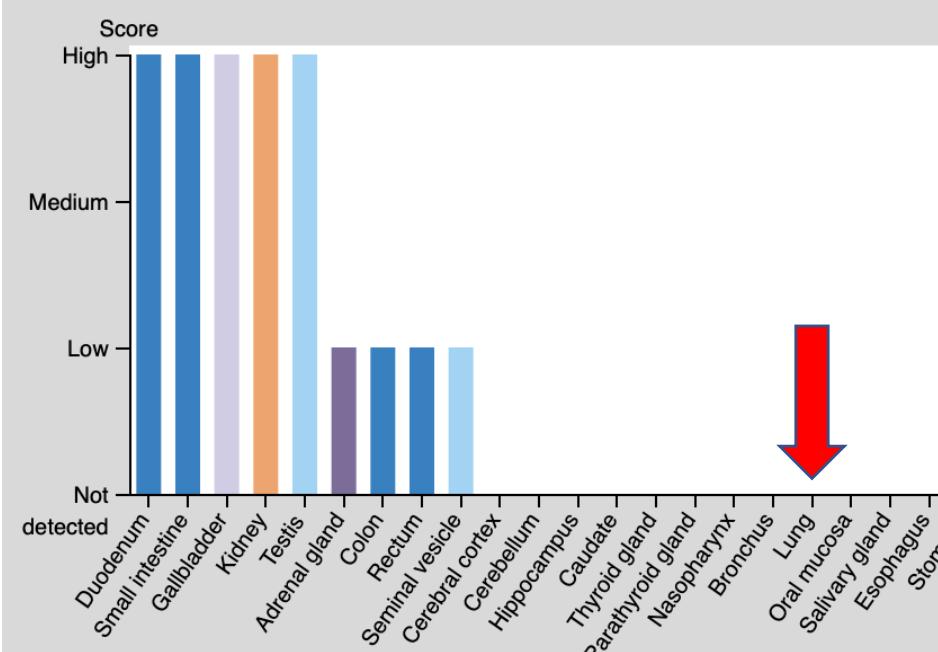

# Receptor binding domain (RBD) antibodies contribute more to SARS-CoV-2 neutralization when target cells express high levels of ACE2

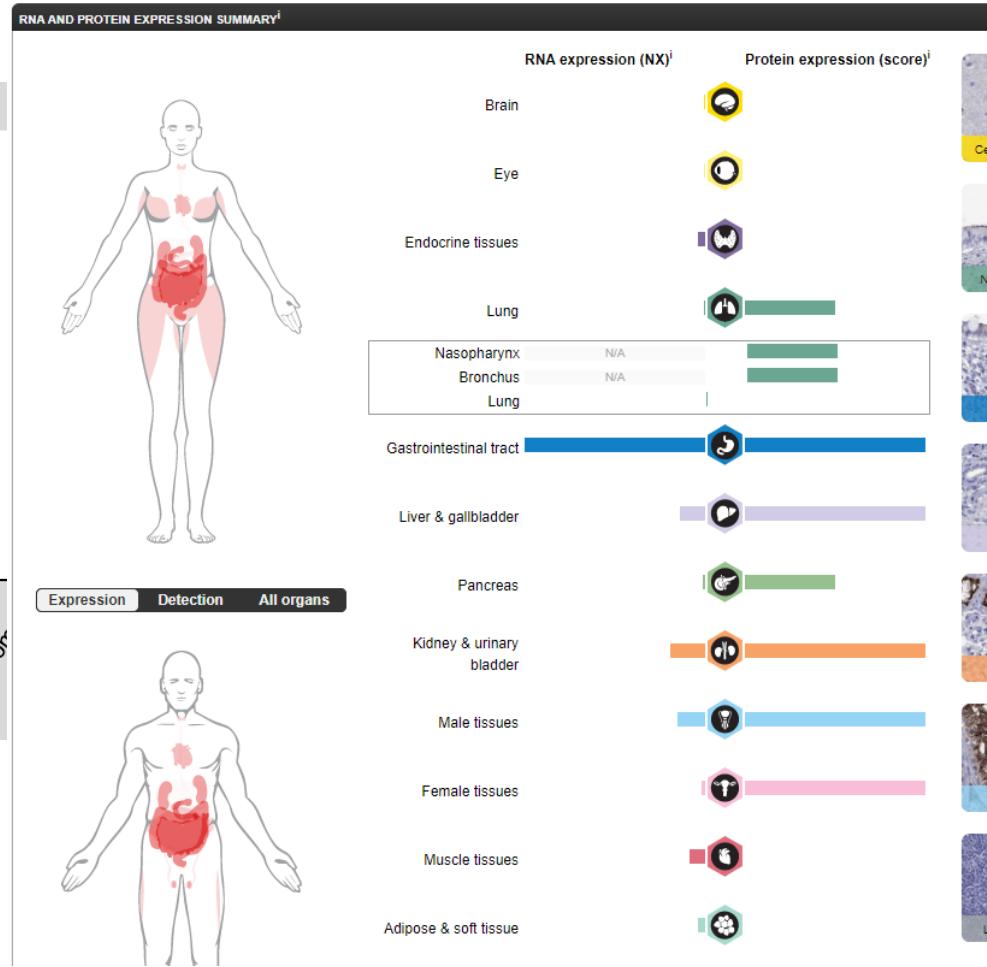

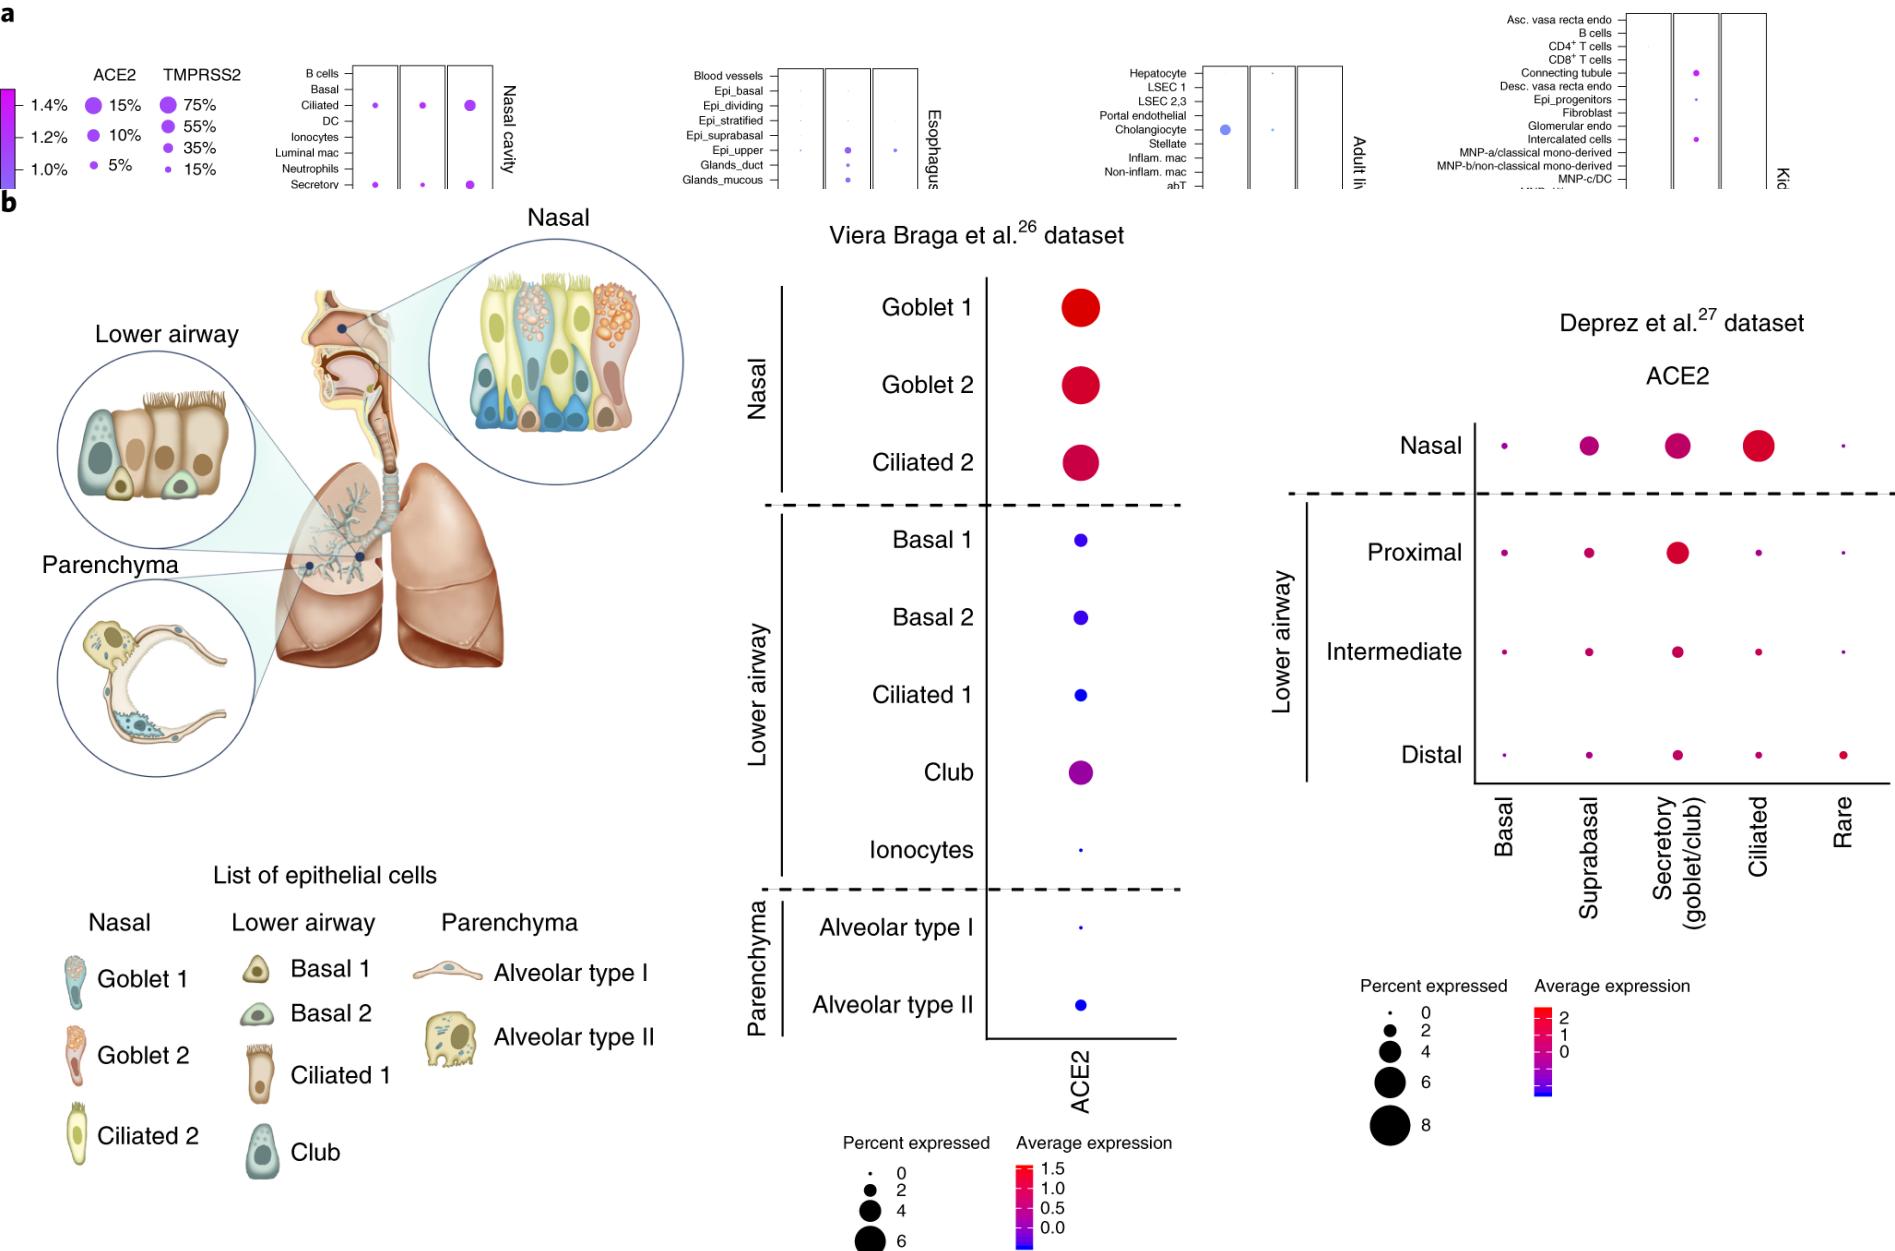

**Fig. 1. 293T cell clones expressing ACE2 at different levels. (A)** ACE2 expression in 293T cells engineered to express different levels of ACE2. ACE2 surface expression was measured by flow cytometry, and the histograms show the distribution of expression levels over a population of cells. Vero E6 cells are included for comparison. **(B)** Relationship between ACE2 expression in the four 293T target cell clones and infection by lentiviral particles pseudotyped with the SARS-CoV-2 D614G spike.

# Exprese ACE2

Trochu zvláštní, že?

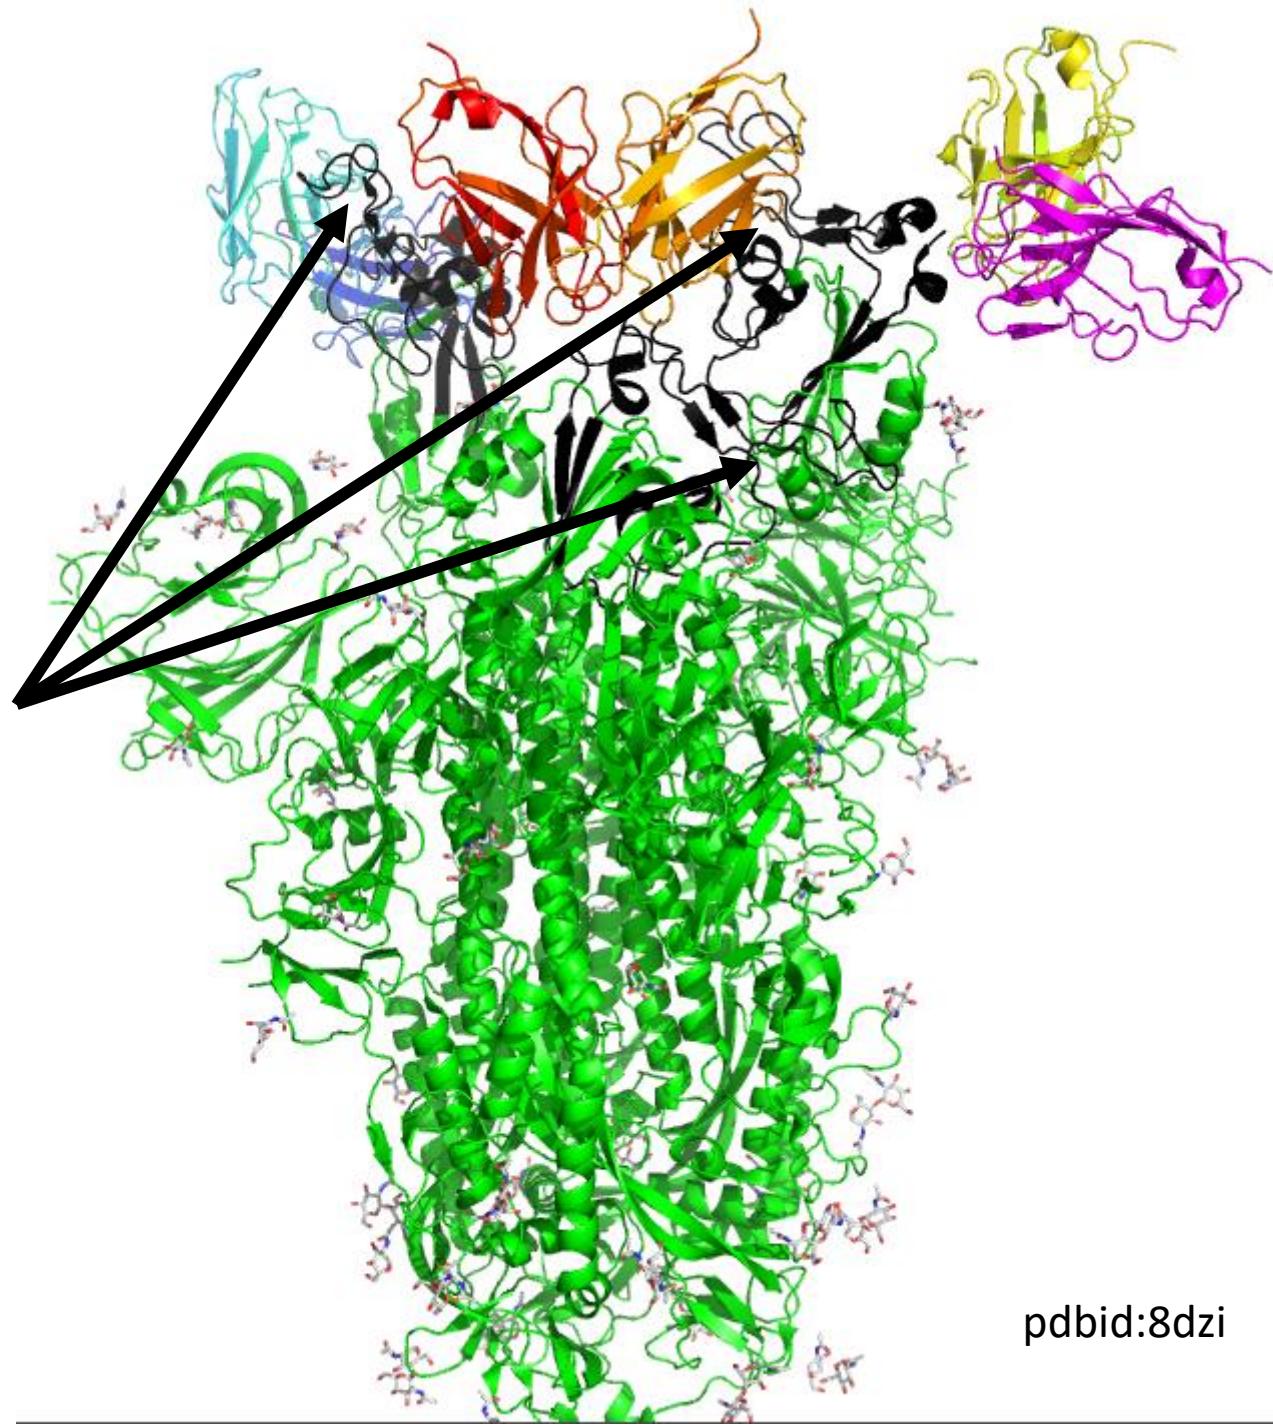

<https://www.nature.com/articles/s41591-020-0868-6>

# Interaction with antibodies

- Neutralizing antibodies binds with RBD domain – blocking ACE2 interaction

# WHO guidelines (13.1.2023)

| Non-severe w risk hospitalization                                     | Severe and Critical                             |
|---|---|
| + 3C-Protease inhibitor<br><b>(nirmatrelvir-ritonavir)(Paxlovid©)</b> | + Systemic corticosteroids (dexamethason)       |
| + RdRp mutator (molnupiravir)   | + IL-6 receptor blockers (tocilizumab)          |
| + RdRp inhibitor (remdesivir)   | + JAK inhibitor (baricitinib)                   |
| - Systemic corticosteroids (dexamethason)                             | + RdRp inhibitor (remdesivir)                   |
| - colchicine  | - JAK inhibitors (ruxolitinib and tofacitinib)  |
| - fluvoxamine   | - RdRp inhibitor(remdesivir)w critical COVID-19 |
| - convalescent plasma   | - convalescent plasma                           |

## NOT recommended (regardless severity)

- Spike antibodies (sotrovimab and casirivimab-imdevimab) – due to Omicron
- Antimalaricium (hydroxychloroquine)
- Anti-HIV protease inhibitor (lopinavir-ritonavir)
- Antiparasitic (ivermectin)

# Remdesivir action

template  
strand      product  
strand

remdesivir

# Remdesivir historie

# Remdesivir aktuálně

- WHO – uprava guidelines

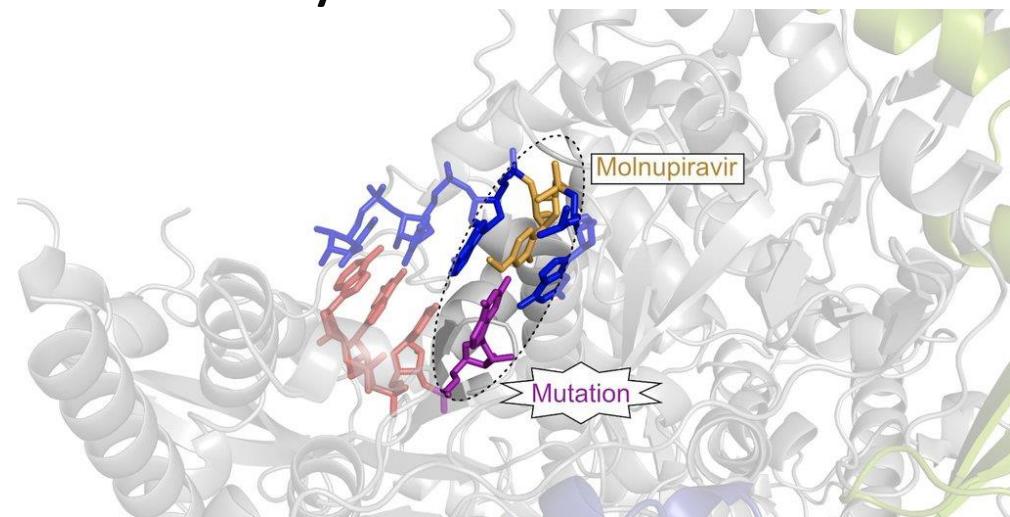

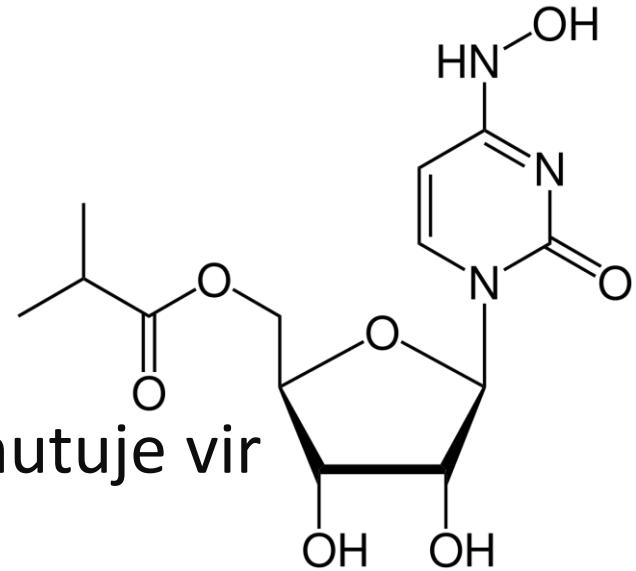

<https://www.who.int/publications/i/item/therapeutics-and-covid-19-living-guideline>

- recommendation **against the use of remdesivir** in hospitalized patients with COVID-19, regardless of disease severity.
- a conditional recommendation for remdesivir for non-severe COVID-19. (as of 13.1.2023)

- EMA – stále autorizovan od 20.7.2020
  - Čekají na kompletní výsledky WHO studie

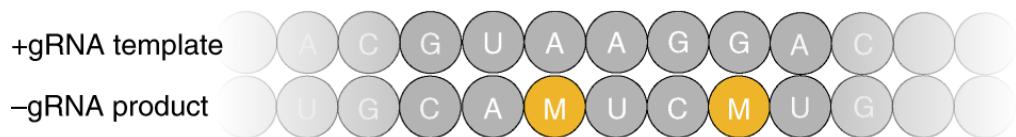

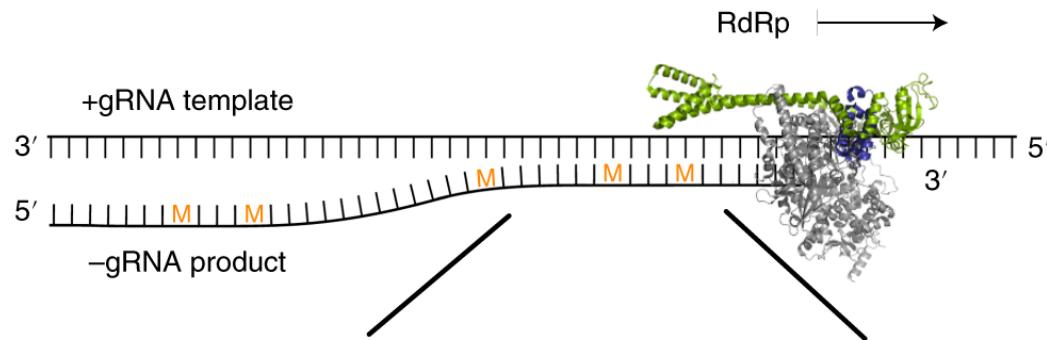

# Molnupiravir

- Pilulka
- Blokuje replikaci SARS-CoV-2 – umutuje vir
- Žádné závažné vedlejší efekty na dobrovolnících
- prevence hospitalizace se závažnými formami a smrtí

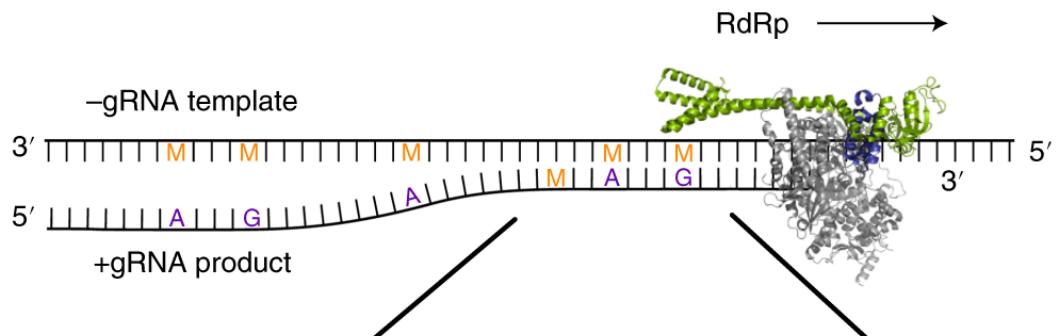

# Molnupiravir MoA

## Step 1: Incorporation

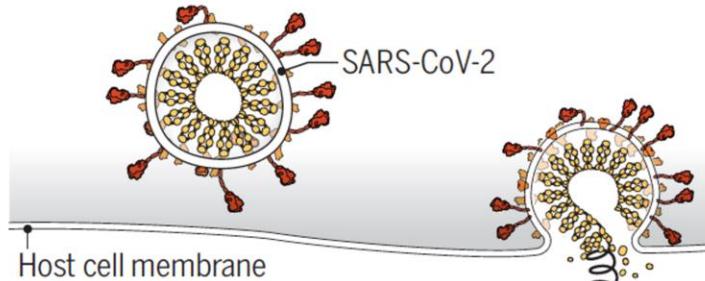

## Step 2: Mutagenesis

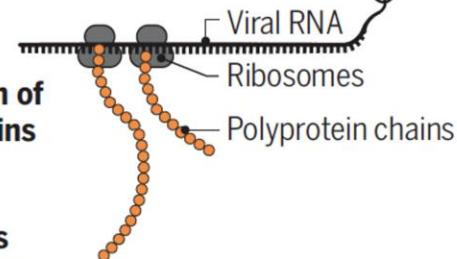

# Paxlovid vs Molnupiravir

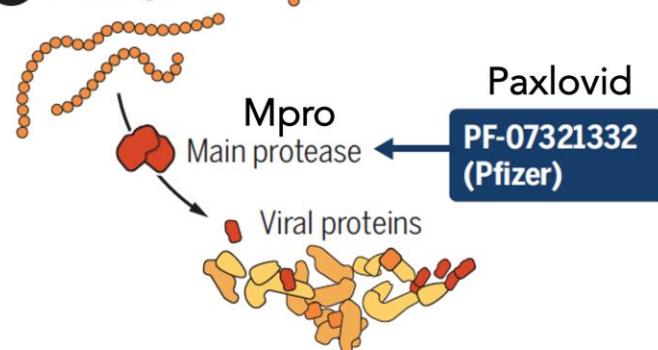

## 1 Attachment and entry

## 2 Translation of viral proteins

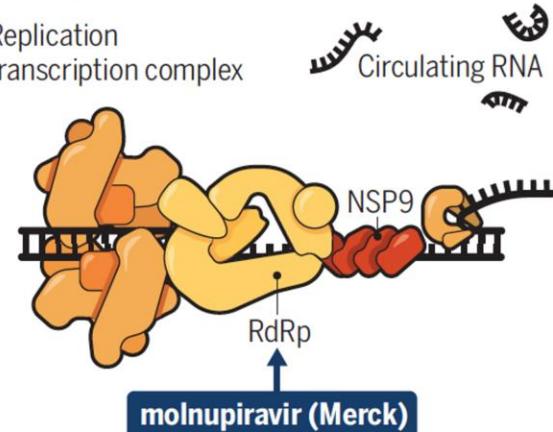

## 3 Proteolysis

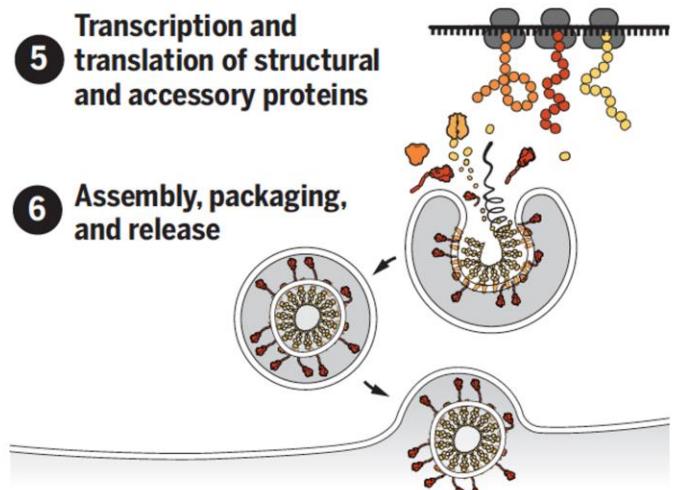

## 4 RNA replication

Replication transcription complex

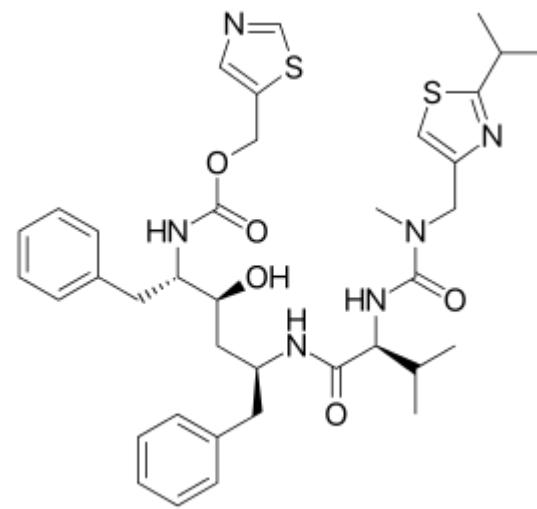

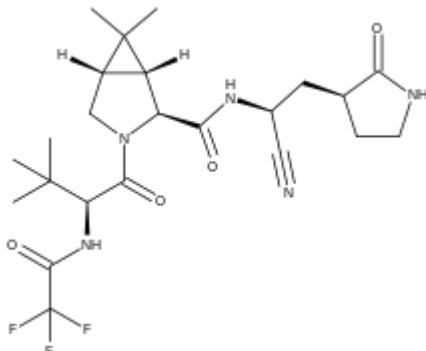

## 5 Transcription and translation of structural and accessory proteins

## 6 Assembly, packaging, and release

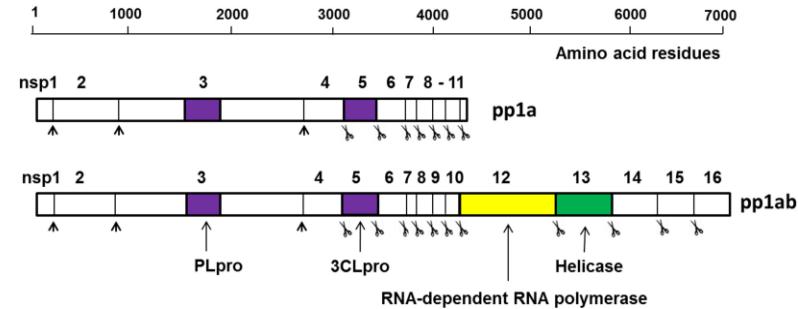

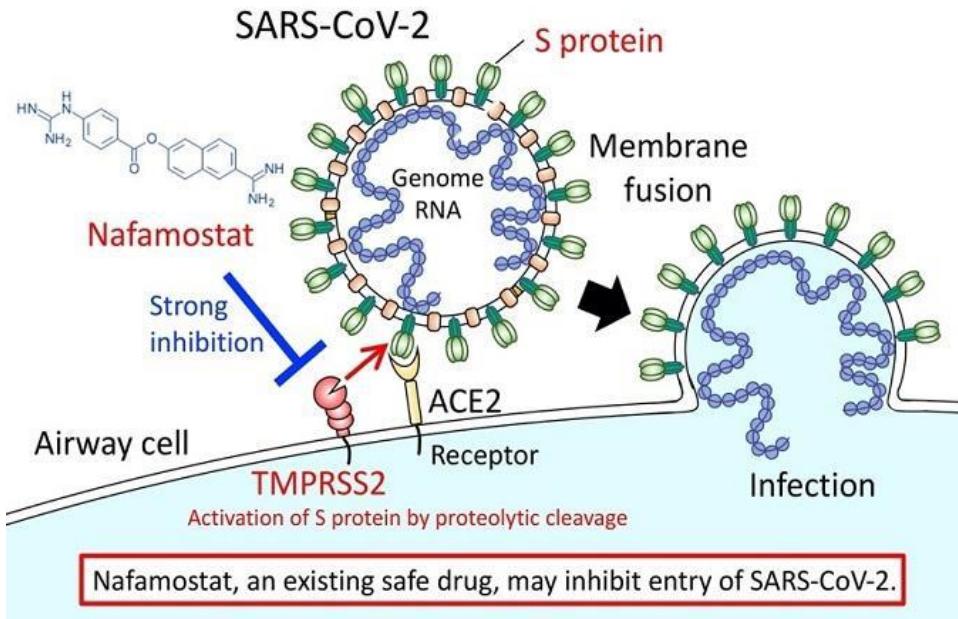

# Paxlovid

- PF-07321332; ritonavir
- orally active 3CL protease inhibitor
- November 2021, Pfizer positive phase II/III results, including 89% reduction in hospitalizations when given within three days after symptom onset

# Protease Inhibitors – Spike and Maturation

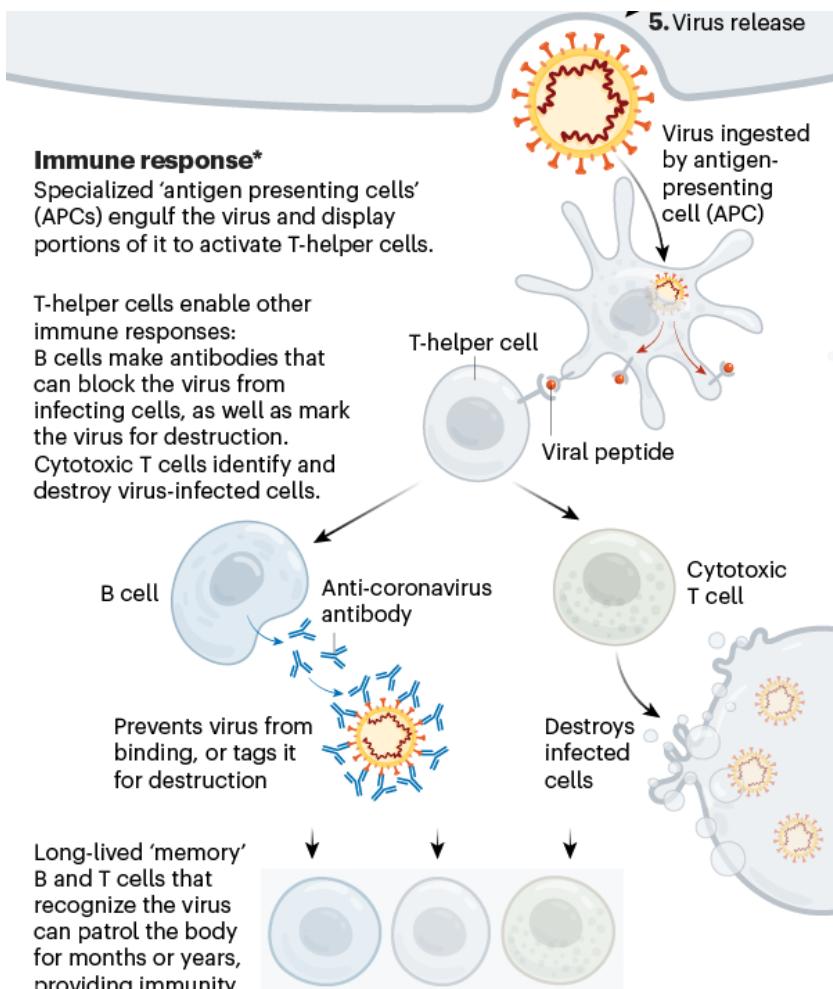

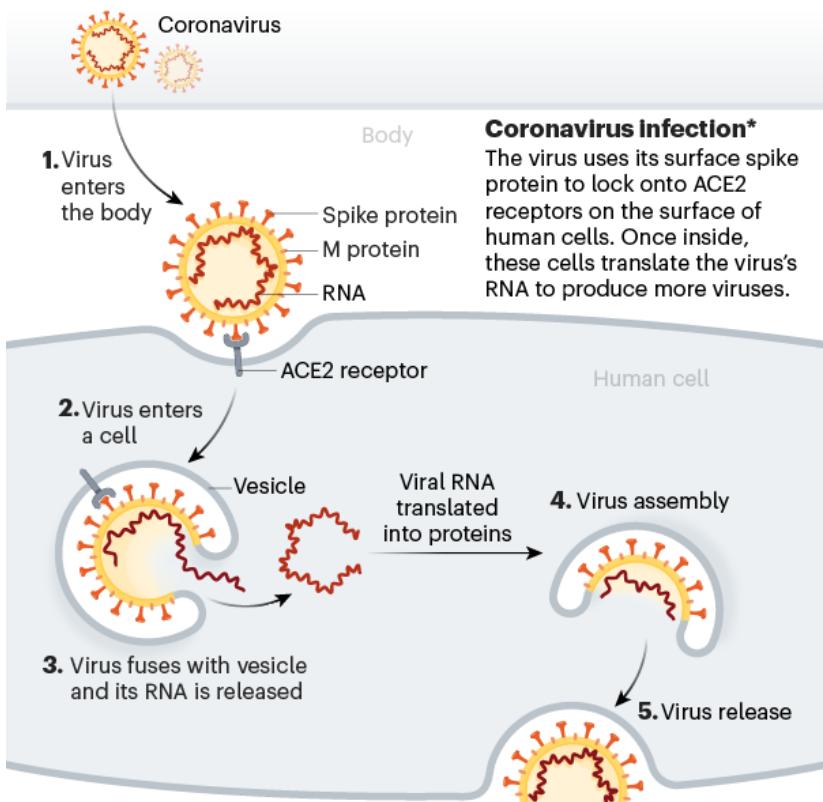

Ineffective – multiple access routes – some do not need TMPrSS2 involvement

# Immunity

## VACCINE BASICS: HOW WE DEVELOP IMMUNITY

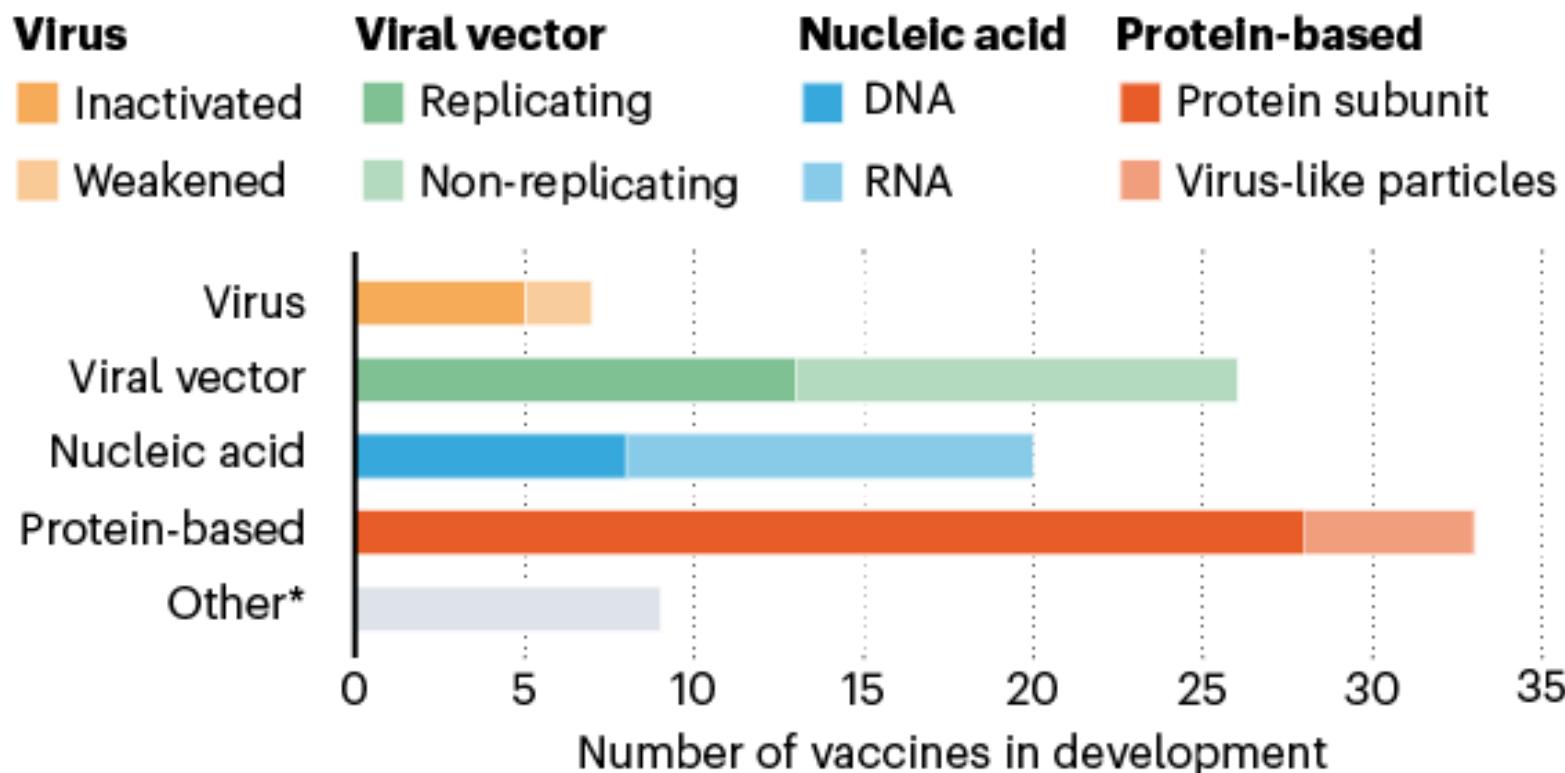

The body's adaptive immune system can learn to recognize new, invading pathogens, such as the coronavirus SARS-CoV-2.

\*Simplified

©nature

# AN ARRAY OF VACCINES

\* Other efforts include testing whether existing vaccines against poliovirus or tuberculosis could help to fight SARS-CoV-2 by eliciting a general immune response (rather than specific adaptive immunity), or whether certain immune cells could be genetically modified to target the virus.

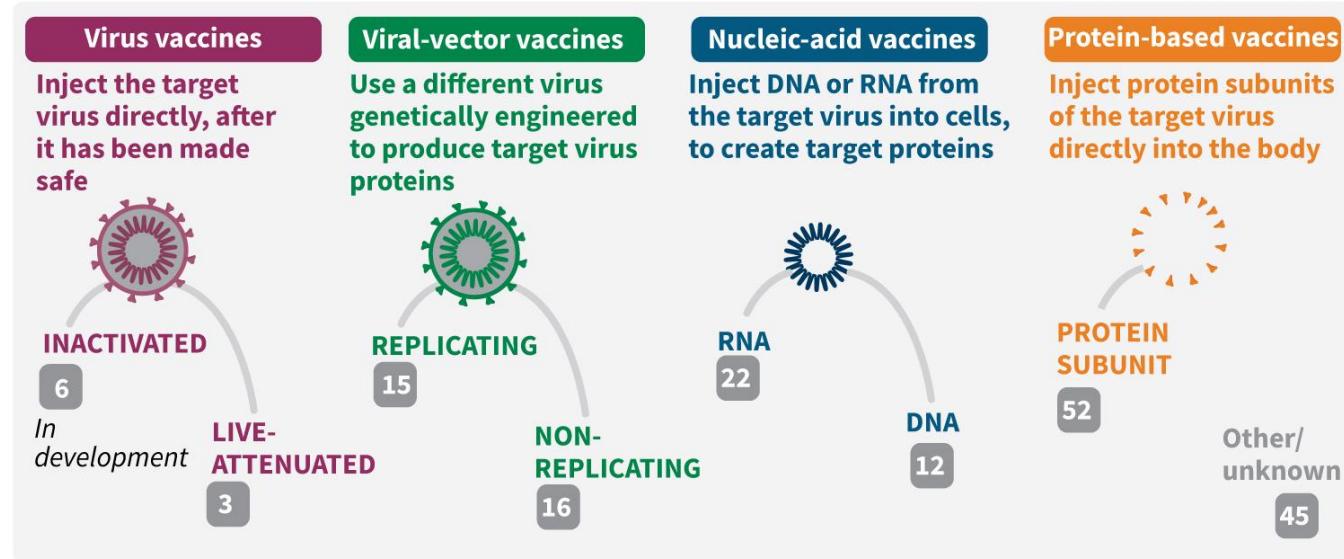

©nature

# Race for a COVID-19 vaccine

There are currently 171 vaccine candidates according to a tracker developed by the London School of Hygiene and Tropical Medicine

## Four main approaches

All aimed at safely triggering the body's natural immune response to SARS-CoV-2

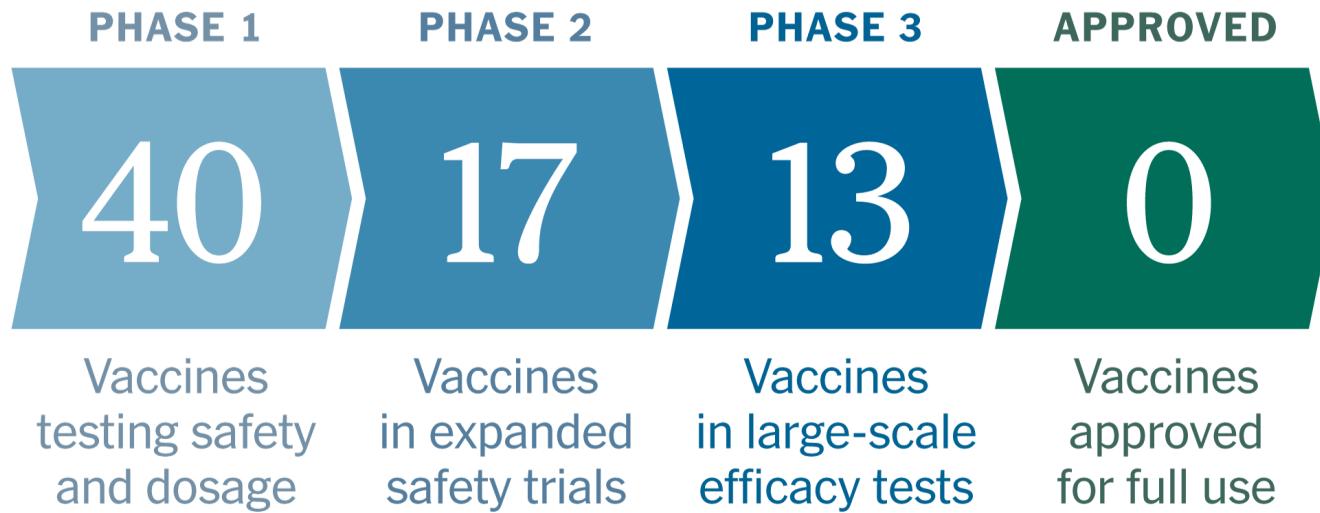

## Development stages

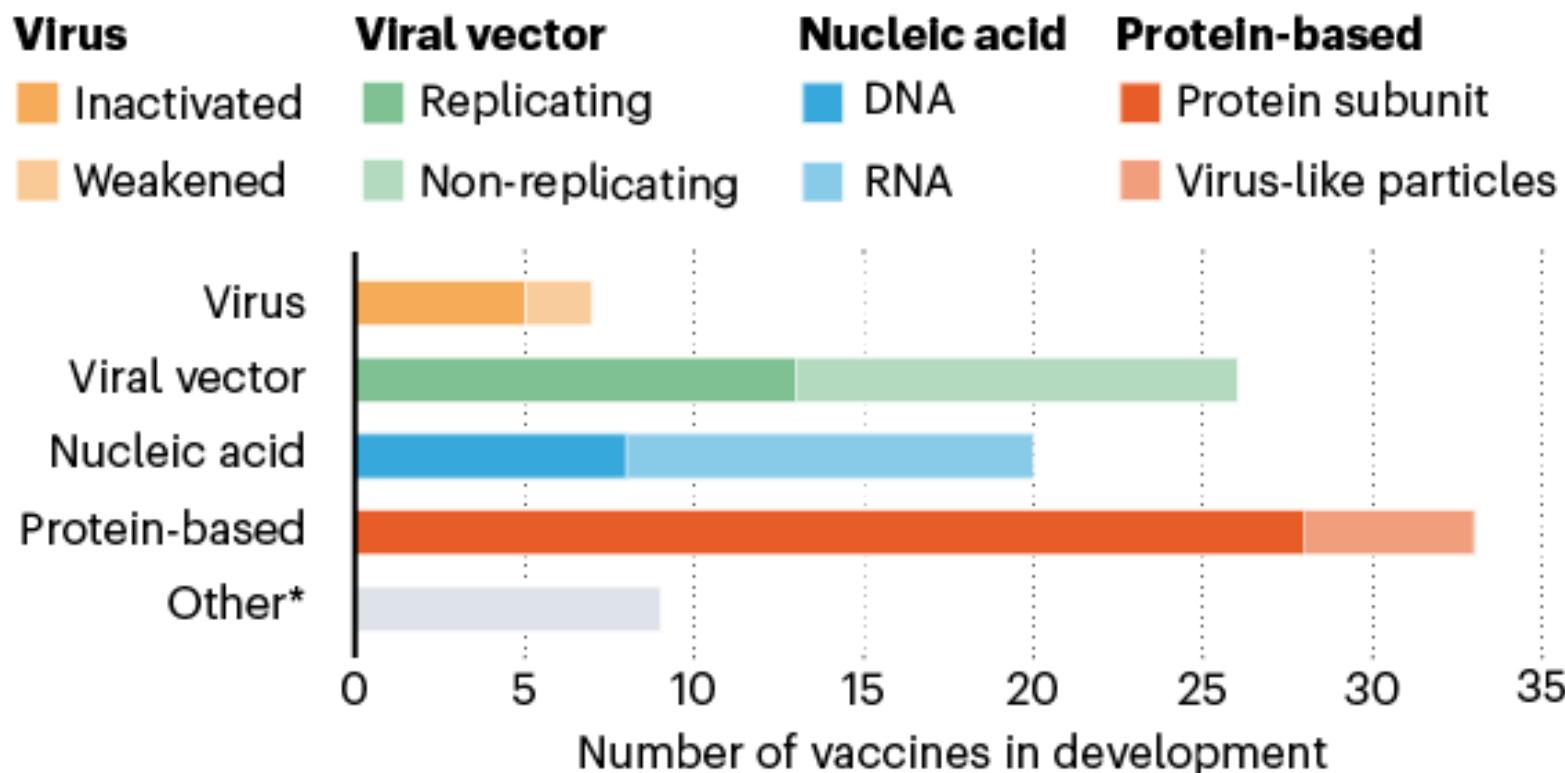

as of May 25

|                 | Pre-clinical | Phase I              | Phase I/II  | Phase II                      | Phase III                          | Licensed |
|-----------------|--------------|----------------------|---|-------------------------------|------------------------------------|----------|
| RNA             | ■■■■■        | •                    | •   | BioNTech Fosun Pharma, Pfizer |                                    |          |
| DNA             | ■■■■■        | •                    | •   |                               |                                    |          |
| Non-replicating | ■■■■■        |                      |   |                               |                                    |          |

| Other/ unknown  | ■■■■■■■■■■   | ■■                   | Beijing Institute of Biological Products<br>Wuhan Institute of Biological Products<br>Sinopharm |                               |                                    |          |

## Coronavirus vaccines in human trials:

# AN ARRAY OF VACCINES

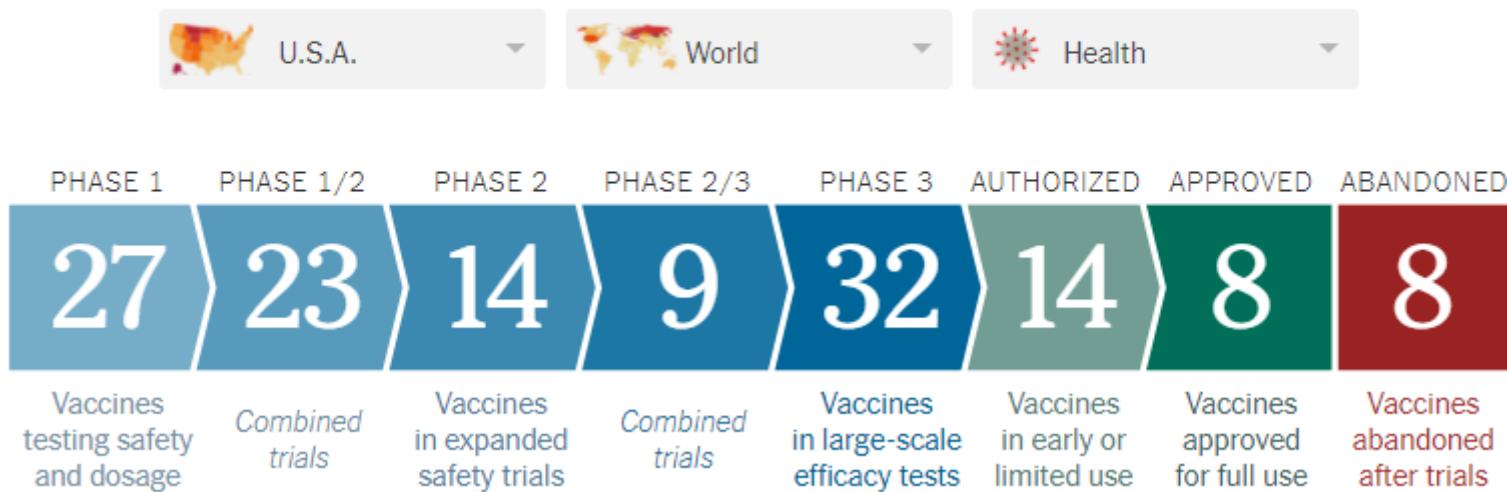

\* Other efforts include testing whether existing vaccines against poliovirus or tuberculosis could help to fight SARS-CoV-2 by eliciting a general immune response (rather than specific adaptive immunity), or whether certain immune cells could be genetically modified to target the virus.

## Coronavirus Vaccine Tracker

By [Carl Zimmer](#), [Jonathan Corum](#) and [Sui-Lee Wee](#) Updated Oct. 23, 2021

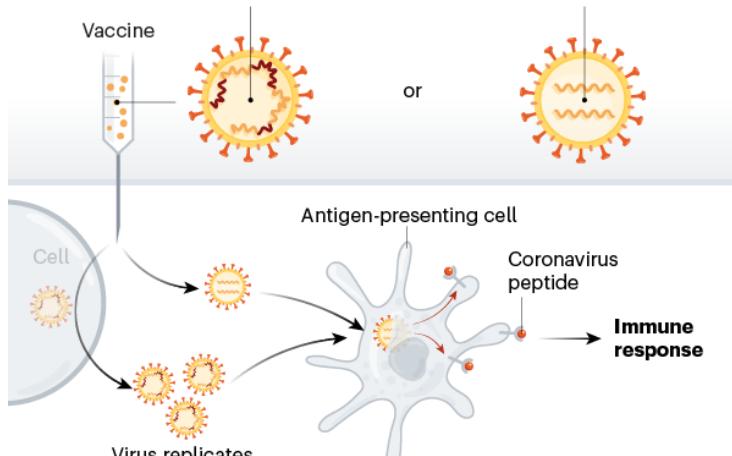

<https://www.nytimes.com/interactive/2020/science/coronavirus-vaccine-tracker.html>

# Vakcíny I

## VIRUS VACCINES

### Weakened virus

A virus is conventionally weakened for a vaccine by being passed through animal or human cells until it picks up mutations that make it less able to cause disease. Codagenix in Farmingdale, New York, is working with the Serum Institute of India, a vaccine manufacturer in Pune, to weaken SARS-CoV-2 by altering its genetic code so that viral proteins are produced less efficiently.

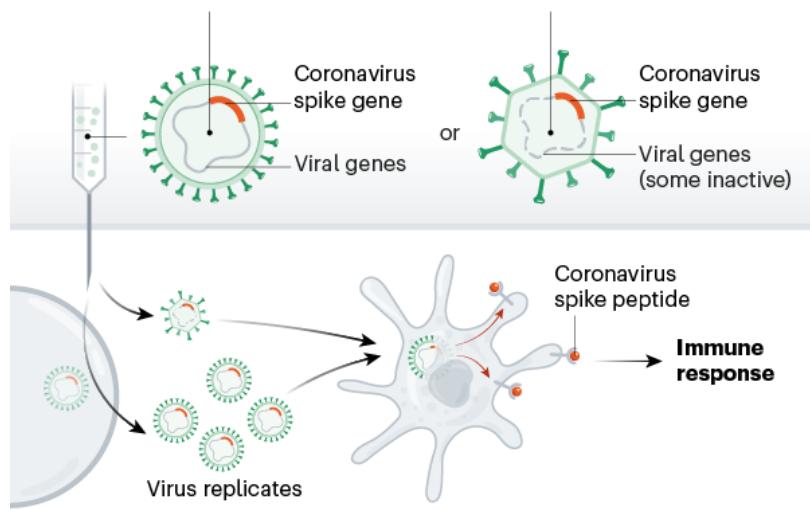

### Inactivated virus

In these vaccines, the virus is rendered uninfected using chemicals, such as formaldehyde, or heat. Making them, however, requires starting with large quantities of infectious virus.

## VIRAL-VECTOR VACCINES

### Replicating viral vector (such as weakened measles)

The newly approved Ebola vaccine is an example of a viral-vector vaccine that replicates within cells. Such vaccines tend to be safe and provoke a strong immune response. Existing immunity to the vector could blunt the vaccine's effectiveness, however.

### Non-replicating viral vector (such as adenovirus)

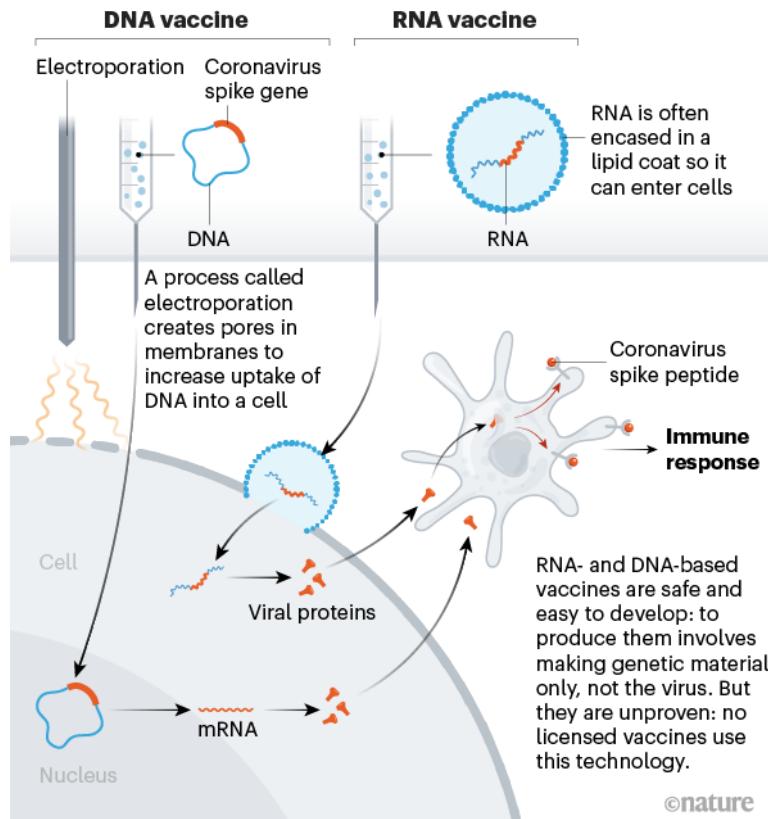

No licensed vaccines use this method, but they have a long history in gene therapy. Booster shots can be needed to induce long-lasting immunity. US-based drug giant Johnson & Johnson is working on this approach.

Sputnik V - two adenovirus vectors with Spike protein- rAd26-S + rAd5-S

# Vakcíny II

## NUCLEIC-ACID VACCINES

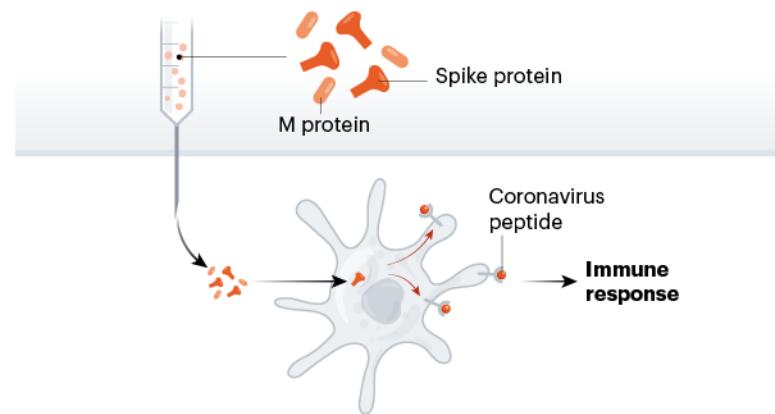

Pfizer-BioNtech – mRNA for Spike protein  
Moderna - mRNA-1273 for Spike protein

## PROTEIN-BASED VACCINES

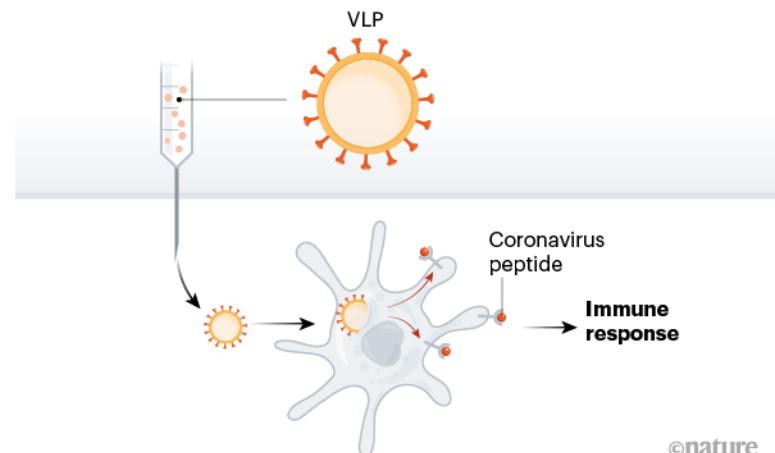

### Protein subunits

Twenty-eight teams are working on vaccines with viral protein subunits — most are focusing on the virus's spike protein or a key part of it called the receptor binding domain. Similar vaccines against the SARS virus protected monkeys against infection but haven't been tested in people. To work, these vaccines might require adjuvants — immune-stimulating molecules delivered alongside the vaccine — as well as multiple doses.

### Virus-like particles

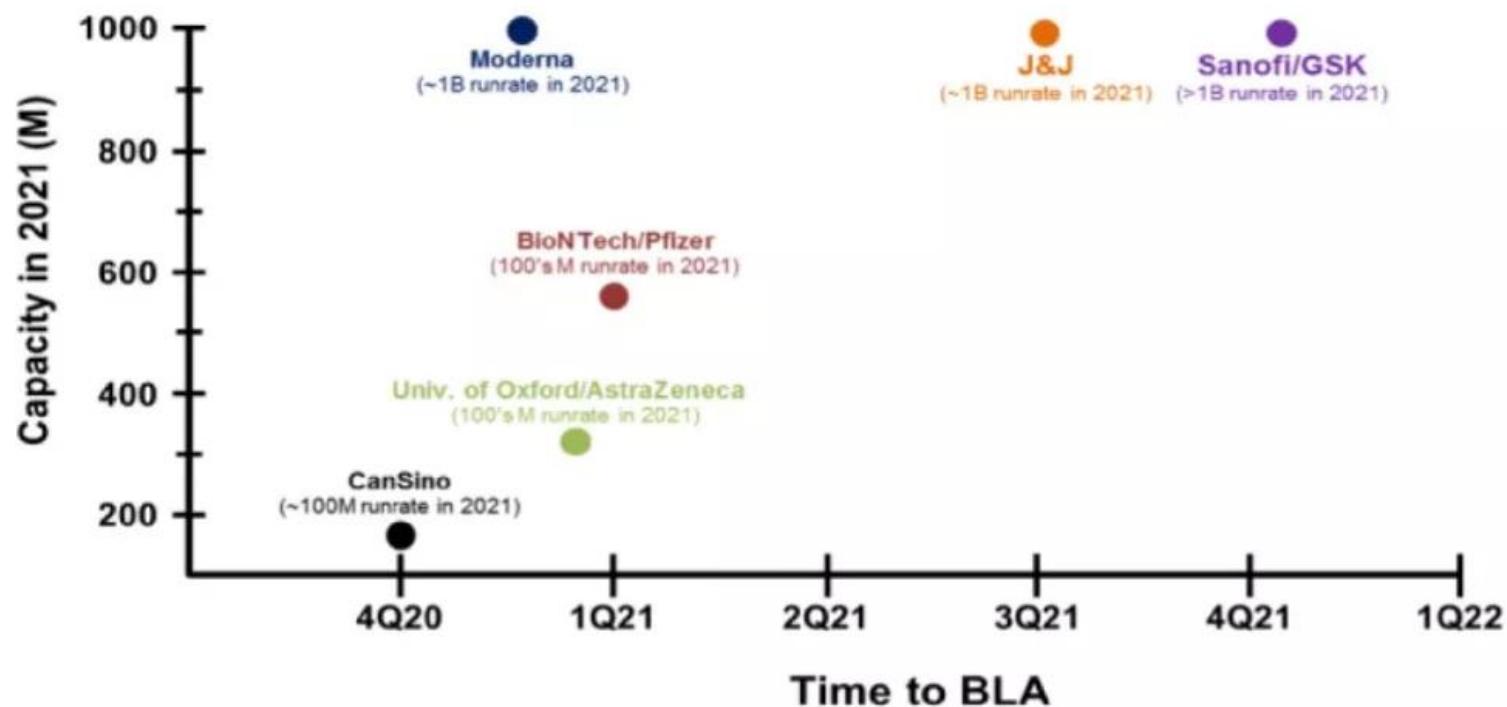

Empty virus shells mimic the coronavirus structure, but aren't infectious because they lack genetic material. Five teams are working on 'virus-like particle' (VLP) vaccines, which can trigger a strong immune response, but can be difficult to manufacture.

# Who is winning the COVID vaccine race?

**Exhibit 1: Potential Vaccine Timeline and Production Capacity**

Source: Morgan Stanley Research, Company reports

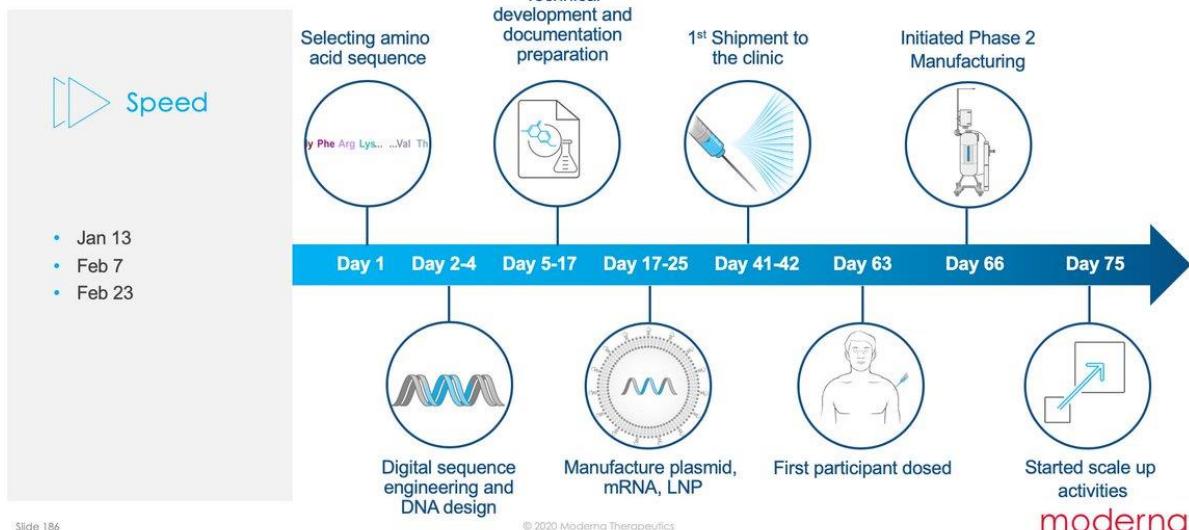

**O**N November 22, the *New York Times* published a fascinating account of the race to produce a coronavirus vaccine. The *Times* report included a number of interesting facts, but one really grabbed my attention: It turns out that the Moderna vaccine, which was just shown to be 95 percent effective, was actually developed by the company in just *two days* in January 2020.

That's right, they developed the vaccine in two days in January, but then needed to spend the following ten months performing tests in order to meet the FDA's standards for vaccine safety and efficacy.

# Moderna/NIAID

## Concept to Phase 1 in 42 days

Slide 186

## Moderna's COVID-19 Vaccine Timeline

- Jan 11: China shares genetic sequence of novel coronavirus
- Jan 13: Moderna finishes the sequence for its coronavirus vaccine
- Feb 7: First clinical batch of vaccine is complete
- Feb 24: Moderna ships vaccines to NIH for the Phase 1 clinical study
- Mar 4: FDA approves clinical trials
- Apr 27: Moderna asks FDA approval for Phase 2 trials
- May 12: FDA gives the vaccine fast track designation
- Oct 22: Moderna completes enrollment of Phase 3 trials
- Nov 16: Interim results of Phase 3 study show 94.5% efficacy
- Nov 30: Final data shows vaccine is 94.1% effective, Moderna requests U.S., Europe approval

# Moderna

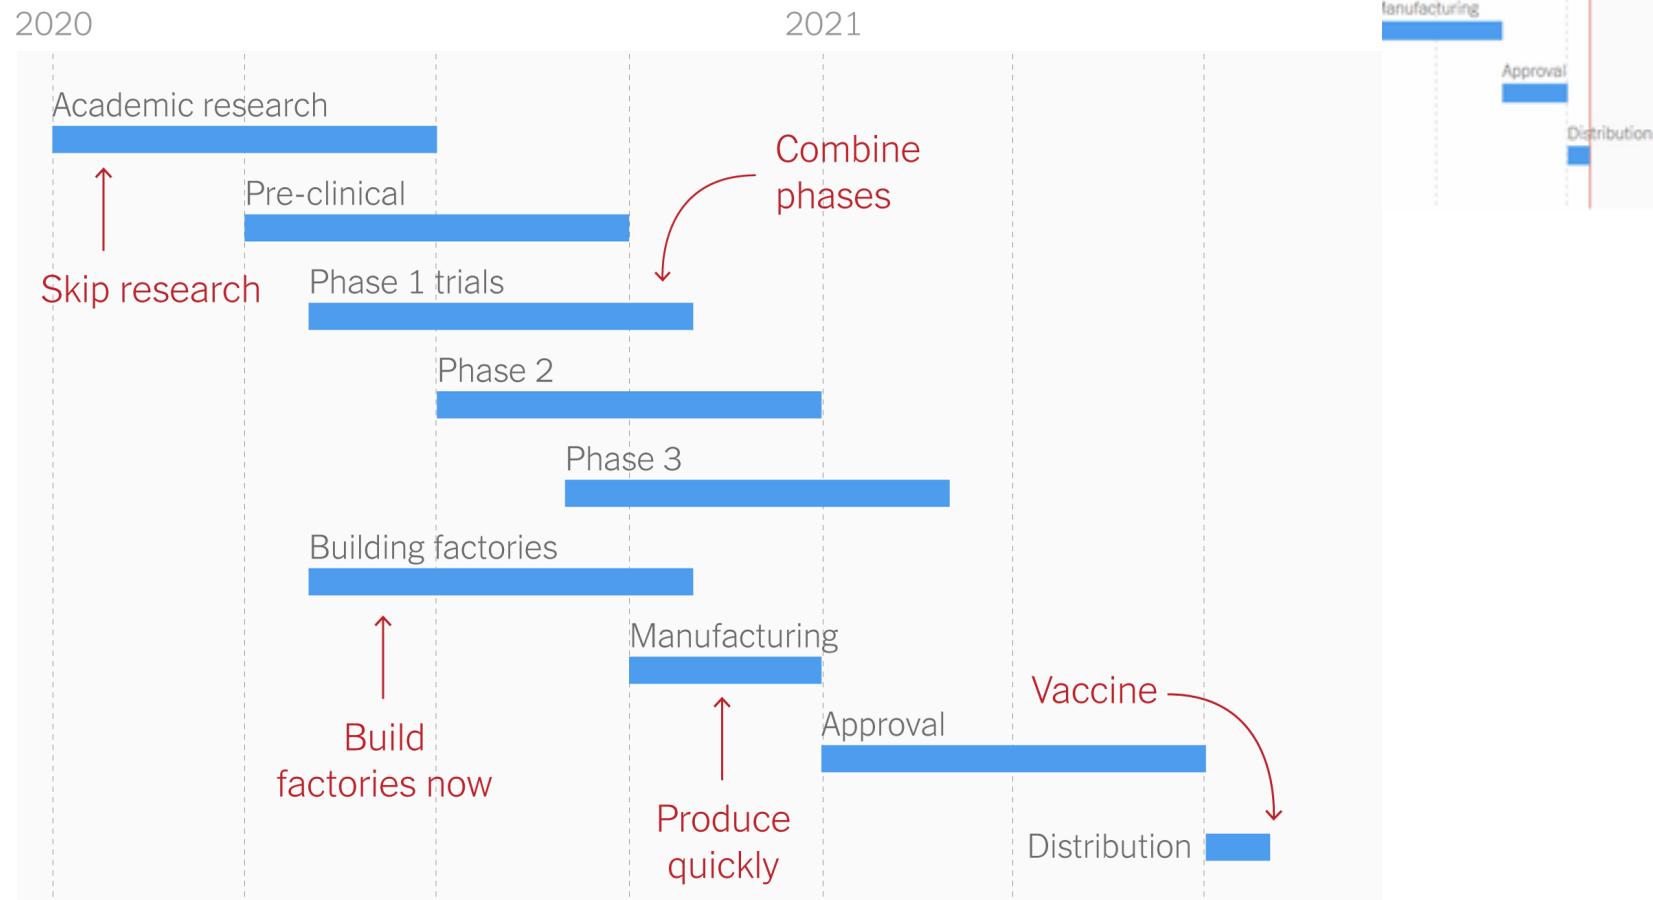

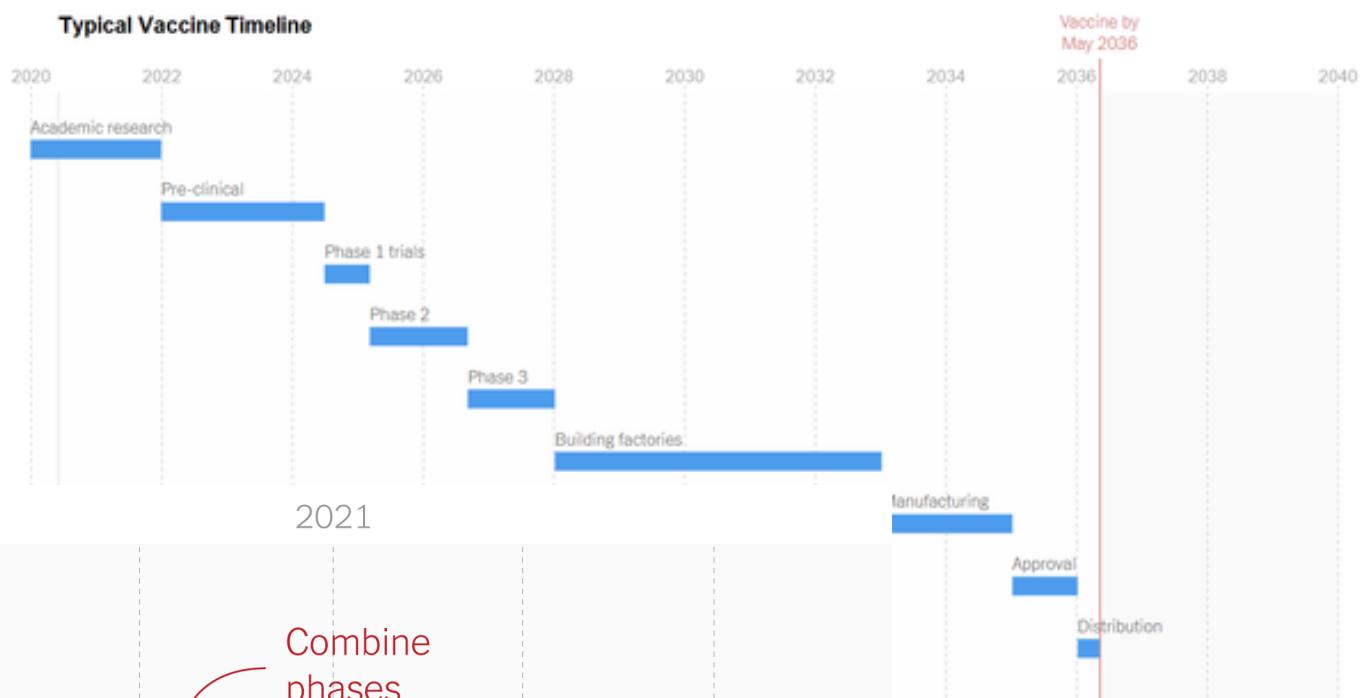

## mRNA vaccine (mRNA-1273) against SARS-CoV-2

- mRNA-1273 is an mRNA vaccine against SARS-CoV-2 encoding for a prefusion stabilized form of the Spike (S) protein of the novel coronavirus, which was selected by Moderna in collaboration with investigators at the National Institute of Allergy and Infectious Diseases (NIAID) Vaccine Research Center (VRC), a part of the National Institutes of Health (NIH)
- First clinical batch for Phase 1, including fill and finishing of vials, was completed on February 7; Batch has been shipped to the NIAID for the Phase 1 study
- NIAID will conduct the Phase 1 clinical study under their IND

# Zamítnuté vakcíny – zvláštní zmínka

ABANDONED

CSL

- Opuštěna 10.12.2020
- Na křečcích fungovala skvěle
- Fáze I – červenec 2020 – skvělé, hodně protilátek, žádné závažné vedlejší účinky
- Ale pak – dobrovolníci začali mít pozitivní testy na HIV, aniž by HIV virus měli
- Důvod: Aby udrželi S protein ve správném tvaru – drželi ho na místě pomocí „molecular clamp“ – ke kterému použili segment HIV proteinu – a ten chytaly protilátkové testy na HIV

# Závěr

- SARS-CoV-2 způsobuje chorobu COVID-19
- Hledání léku a jeho testování postupuje neskutečně rychle díky mezinárodní spolupráci a obrovskému nasazení vědců, firem a donátorů
- Zkouší se různé strategie léčby, ale většina bohužel nemá příliš silné výsledky
- Zatím nejnadějněji vypadají vakcíny
