supervisor: **Pavel Polishchuk**

## 1KE7

CYCLIN-DEPENDENT KINASE 2 (CDK2) COMPLEXED WITH 3-[[[(2,2-DIOXIDO-1,3-DIHYDRO-2-BENZOTHIEN-5-YL)AMINO]METHYLENE]-5-(1,3-OXAZOL-5-YL)-1,3-DIHYDRO-2H-INDOL-2-ONE

PDB DOI: 10.2210/pdb1KE7/pdb

Classification: **TRANSFERASE**

Organism(s): Homo sapiens

Expression System: Spodoptera frugiperda

Mutation(s): No

Deposited: 2001-11-14 Released: 2002-05-14

Deposition Author(s): Bramson, H.N., Corona, J., Davis, S.T., Dickerson, S.H., Edelstein, M., Frye, S.V., Gampe, R.T., Hassell, A.H., Shewchuk, L.M., Kuyper, L.F.

### Experimental Data Snapshot

Method: X-RAY DIFFRACTION

Resolution: 2.00 Å

R-Value Free: 0.235

R-Value Work: 0.191

# Molecular dynamics

1. MD simulations **mimic the physical motions of atoms present in the actual environment;**
2. The atoms and molecules are allowed to interact for a fixed period of time, giving **a view of the dynamic "evolution" of the system.**

- to explore conformational space
- to explore biological process of molecular recognition
- to investigate ligand pose stability
- to explore protein flexibility
- to estimate binding affinity of protein-ligand (protein-protein) complexes

<https://doi.org/10.1016/j.str.2017.02.009>

# Classical Molecular Dynamics

Simulation  
process is  
based on  
Newton's  
second law

- ## Molecular Dynamics
1. Assign velocities to all atoms
  2. Calculate forces on all atoms
  3. Use Newton's second law to calculate acceleration on each atom
$$F = ma$$

4. Calculate velocities for the next timestep
5. Use change of velocities to get coordinates for next timestep
6. Go to step 2.

# What can be done by MD

- To explore different conformation of protein
  - To investigate internal-flexibility of protein
  - For practical use we select conformations from the most populated clusters of all conformations

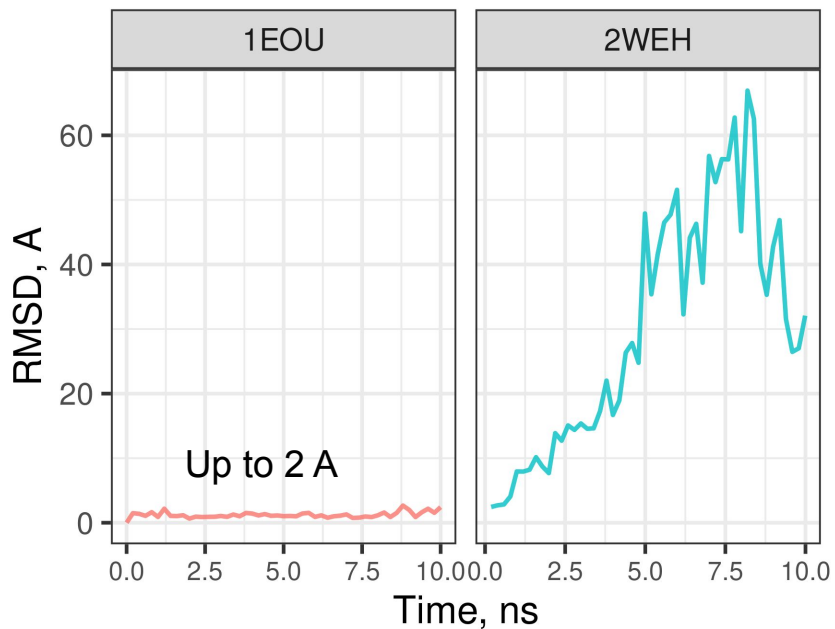

Conformation can be used:  
- for further molecular docking study

# What can be done by MD

- To explore stability of ligand pose

RMSD example 10ns 310K

## Example of incorrect protonation and pose:

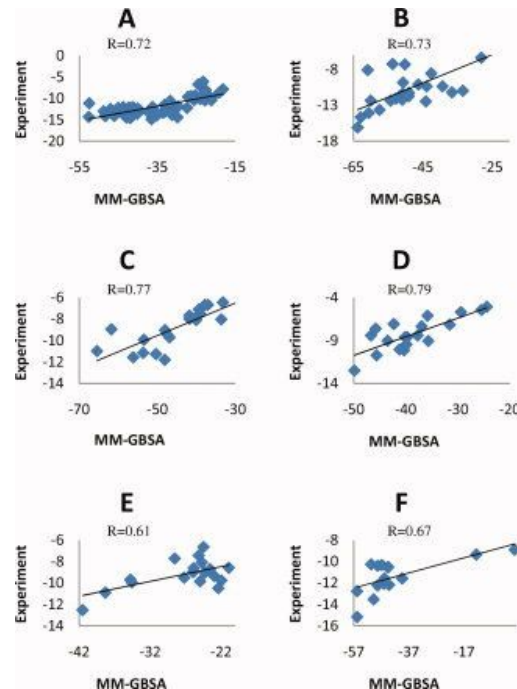

# What can be done by MD

- to estimate binding affinity of protein-ligand complexes

Correlation between **MM-GBSA** predicted and experimental binding free energy.

# Classical Molecular Dynamics

Preprocessing

Pre-simulation  
steps

## Structure Preparation

### Force-field

- Definitions of inter-atomic bonded and no-bonded forces (ligand and protein)

### Simulation box setup

- box size/shape

### Solvate system

- add HOH molecules

### Neutralize system

- add NA<sup>+</sup>/CL<sup>-</sup> ions

### Energy minimization

- Stop minimization when the max force < 1000.0 kJ/mol/nm
- to ensure that the system has no steric clashes or inappropriate geometry

### NVT and NPT equilibration

- 1000 ps
- equilibrate the solvent and ions around the protein

## Product Simulation

## Analysis

FAST. FLEXIBLE. FREE.

**GROMACS**

**Aim:** to implement an easy to use tool to run whole pipeline of  
Molecular Dynamics simulation automatically

Perform **High-Throughput Molecular Dynamics**

**Rank compounds by:**

- Stability of previously obtained pose of ligand
- Calculated Binding Energy
- Stability of protein-ligand contacts

README

## StreaMD: a tool to perform high-throughput automated molecular dynamics simulations

### installation

Source: [https://valdes-tresanco-ms.github.io/gmx\\_MMPBSA/installation/](https://valdes-tresanco-ms.github.io/gmx_MMPBSA/installation/)

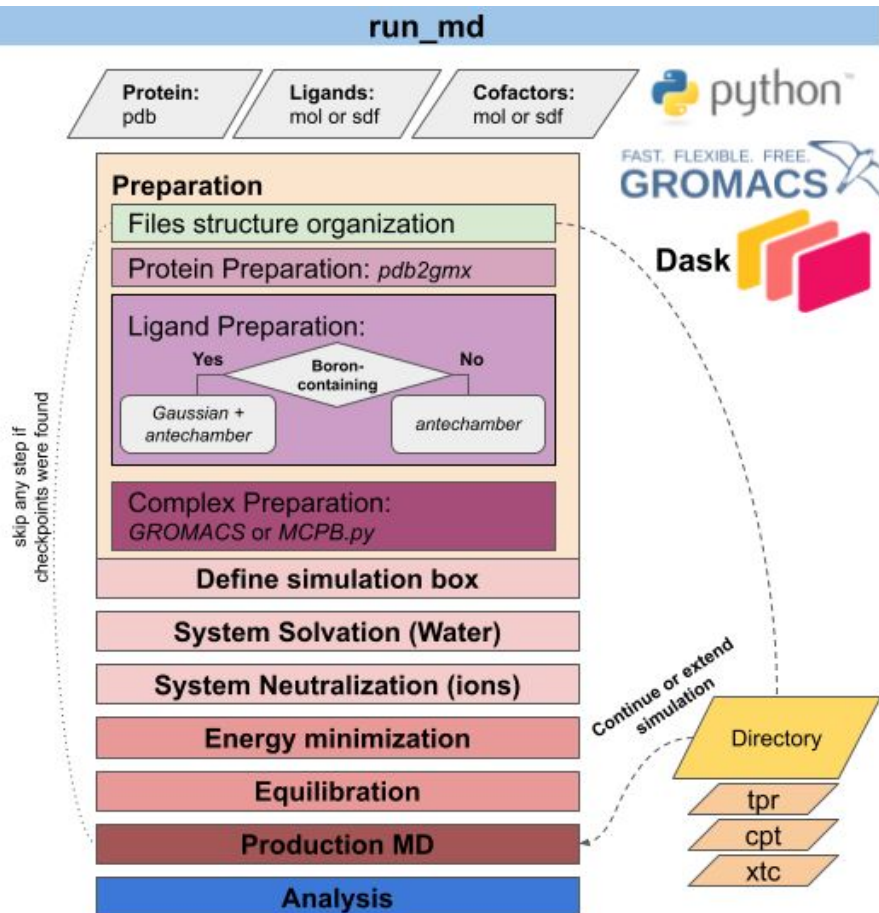

We recommend to install the package using `conda` and `mamba`. To use exclusively `conda` one can simply replace `mamba` calls with `conda`.

```
conda install -n base -c conda-forge mamba
```

***The tool is already implemented  
and free available***

<https://github.com/ci-lab-cz/md-scripts>

### Automatic Analysis:

#### System preparation analysis:

potential.png - potential energy  
temperature.png  
pressure.png  
density.png

#### Trajectory analysis:

rmsd.png - rmsd of the protein against minimized structure  
rmsd\_xtal.png - rmsd of the protein against crystal structure  
rmsd\_cofactor-molid.png - rmsd of each cofactors  
rmsd\_ligand-molid.png - rmsd of the ligand  
rmsf.png - root mean square fluctuation (standard deviation) of atomic positions  
gyrate.png - radius of gyration

### run\_gbsa

- prepare arguments and calculate MMP(G)PBSA energy using **gmx\_MMPBSA** tool
- **Input:** *directory* or *top*, *ndx*, *xtc* files
- use default *mmpbsa.in* if file was not set
- automatic calculation of the appropriate MPI Processes
- parse outputs and save aggregated csv file

### run\_prolif

- Get protein-ligand interactions from MD trajectories using **ProLIF** module
- **Input:** *directory* or *tpr*, *xtc* files
- CSV and png output files

# Main features of the tool:

- **User control of simulation time**
  - from 10 ps to 1  $\mu$ s
- **Default preset optimal parameters to run Molecular Dynamics**
  - can be easily modified
  - useful as teaching source
- **Support of modeling of different molecular systems**
  - protein only, protein-ligand, protein-ligand-cofactor(s)
- **Support of modeling of boron-containing molecules**
  - using Gaussian tool
- **Ability to continue interrupted or to expand already finished simulations**
- **Support of distributed computing using dask library provides**
- **Automatic analysis of simulation:**
  - RMSD plots for both protein and ligand objects
  - Plot of flexibility of each amino acids (RMSF)
- **Support of analysis by additional instruments:**
  - **ProLIF**: Ligand-Protein interactions (time-dependent function, stability analysis)
  - **MM(PB)GBSA**: Calculation of Binding Energy

# Structure preparation

UCSF CHIMERA  
an Extensible Molecular Modeling System

UCSF Chimera is a program for the interactive visualization and analysis of molecular structures and related data, including density maps, trajectories, and sequence alignments. It is available free of charge for noncommercial use. Commercial users, please see [Chimera commercial licenses](#).

We encourage Chimera users to try **ChimeraX** for much better performance with large structures, as well as other major [advantages](#) and completely new features. ChimeraX includes a significant subset of Chimera features (with more to come, see the [missing features list](#)) and is under active development. Users may choose to use both programs, and it is fine to have both installed.

**Chimera is no longer under active development**, and is only updated for critical maintenance. Chimera development was supported by a grant from the [National Institutes of Health](#) (P41-GM103311) that ended in 2018.

### Feature Highlight

#### Pipes and Planks

The [PipesandPlanks](#) tool shows protein helices as "pipes" (cylinders) and strands as "planks" (rectangular boxes), with connectors for the intervening coil. Adjustable settings include pipe radius, plank width, colors, and whether to include arrowheads to show chain N-C directionality (see [image hotspot](#)).

(More features...)

### Gallery Sample

#### Peroxidoxin Wreath

Peroxidoxins are enzymes that help cells cope with stressors such as high levels of reactive oxygen species. The image shows a decameric peroxidoxin from human red blood cells (Protein Data Bank entry [1omy](#)), styled as a holiday wreath.

See also the [RBVI holiday card gallery](#).

# Protein and ligand preparation. Home scripts

<https://github.com/ci-lab-cz/docking-files/tree/main>

## Docking preparation procedure

### [PDB download](#)

#### By script:

```
python scripts/get_pdb_fasta_mol_bypdbid.py -i 5tgz 5u09 -o P21554
```

it returns:

```
P21554/  
ligands_frompdb.smi (can use for pdb2mol script)  
P21554/5tgz/  
5tgz.pdb  
5tgz.fasta  
5tgz_ligands_frompdb.sdf  
5tgz_ligands_frompdb.smi  
ligands_list.log
```

#### or by PDB downloader

### [Target preparation](#)

- 1) Open Chimera
- 2) Fetch PDBIDs (space as separator)

File → Fetch by ID

- 3) Select chosen chains (remove other chains)

Select menu

Select chain (if chains: Select → Selection mode → append) → Invert (all models) → Actions → Atoms/Bonds → delete

- 4) Align structures

Tools → Structure comparison → MatchMaker

This is an optional step. It is required if at least one structure of the same protein is already present in prepared files. In such a case select the first structure from the prepared ones by alphabetic order and use it as a reference to align a new one. This will simplify analysis of docking to different X-ray

## README

### Complexes prepared for docking

This is a repository of protein-ligand complexes prepared for docking in PDB nad PDBQT formats.

The detailed pipeline is described in the document `Target-prepare_desgn.docx`. Please follow it if you contribute a new structure.

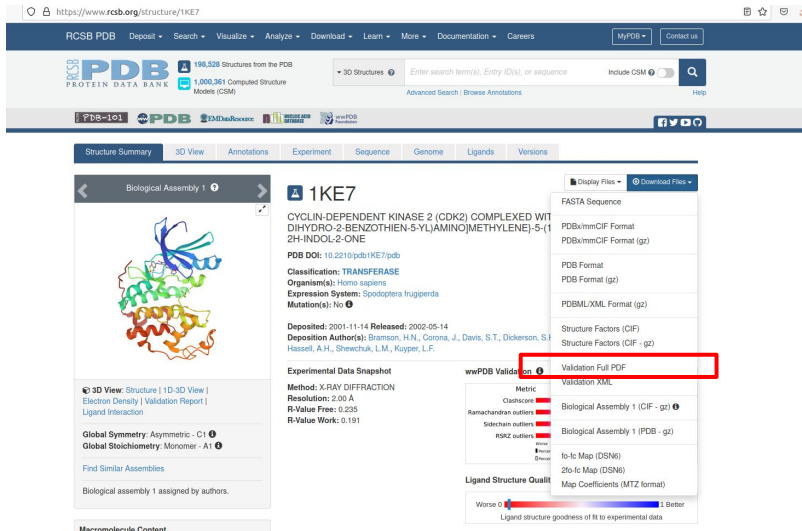

The major feature is that all structures of an individual protein are aligned and a single grid box is used for all of them.

The repository is composed of directories for individual proteins, where every directory has the following structure:

# Protein preparation

1. Download structure from PDB (<https://www.rcsb.org/>) using PDBID

*Download Files -> PDB Format*

The screenshot shows the RCSB PDB website interface for structure 1KE7. The main content area displays the protein structure as a ribbon diagram and provides detailed information including classification (TRANSFERASE), organism (Homo sapiens), and experimental data (X-RAY DIFFRACTION). A dropdown menu titled 'Download Files' is open on the right side, listing various file formats. The 'Validation Full PDF' option is highlighted with a red box. Other options include FASTA Sequence, PDB/mmCIF Format, PDB Format, PDBML/XML Format, Structure Factors (CIF), and Validation XML. Below the dropdown, there are metrics for wwPDB Validation and Ligand Structure Quality.

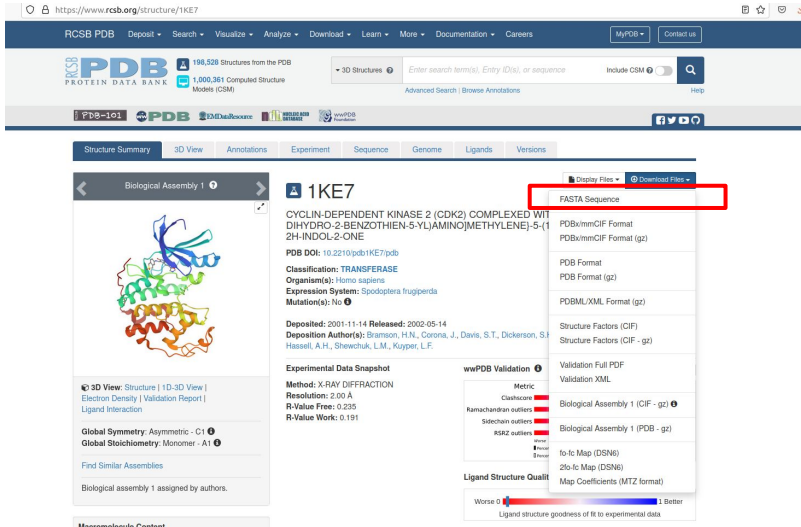

# Protein preparation

1. Download structure from PDB (<https://www.rcsb.org/>) using PDBID

*Download Files -> PDB Format*

2. Download sequence from PDB or from UniProt

*Download Files -> Fasta Sequence*

The screenshot shows the RCSB PDB website interface for entry 1KE7. The main navigation bar includes 'RCSB PDB', 'Deposit', 'Search', 'Visualize', 'Analyze', 'Download', 'Learn', 'More', 'Documentation', and 'Careers'. The search bar contains '1KE7' and shows '198,529 Structures from the PDB' and '1,009,361 Computed Structure Models (CSM)'. The entry details for 1KE7 are displayed, including the protein name 'CYCLIN-DEPENDENT KINASE 2 (CDK2) COMPLEXED WITH DIHYDRO-2-BENZOTHIEN-5-YLJAMINOMETHYLENE]-5-(1-2H-INDOL-2-ONE)', PDB DOI, classification as 'TRANSFERASE', organism 'Homo sapiens', and experimental data such as 'Method: X-RAY DIFFRACTION' and 'Resolution: 2.00 Å'. A 'Download Files' dropdown menu is open, showing options like 'FASTA Sequence', 'PDB/mmCIF Format', 'PDB Format', and 'PDBML/XML Format (gz)'. The 'FASTA Sequence' option is highlighted with a red box.

# Protein preparation

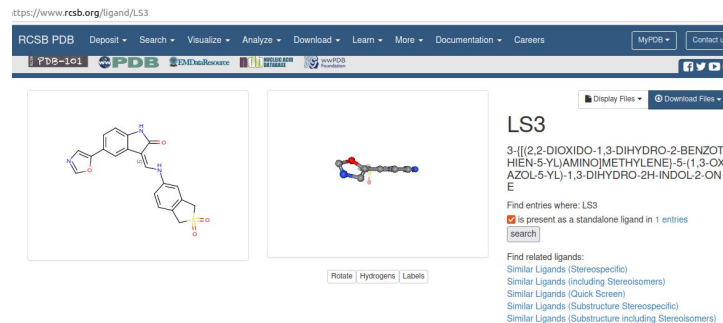

1. Download structure from PDB (<https://www.rcsb.org/>) using PDBID

*Download Files -> PDB Format*

2. Download sequence from PDB or from UniProt

*Download Files -> Fasta Sequence*

3. Save smiles of ligand into file (*ligand.smi*)

## AMBER Histidine residues

Histidine (HIS in normal pdb files) is really one of three possible residues:

**HID**: Histidine with hydrogen on the delta nitrogen

**HIE**: Histidine with hydrogen on the epsilon nitrogen

**HIP**: Histidine with hydrogens on both nitrogens; this is positively charged.

It is up to the user to inspect the environment of each histidine and identify the type that is appropriate.

4. Open Fasta and PDB in Chimera
- d. Set HIS protonated state

*Tools -> General Controls -> Command line*

Put in the Command line:

```
setattr r type HID :HIS@HD1,DD1,TD1,HND  
setattr r type HIP :HIS@HE2,DE2,TE2  
setattr r type HIE :HIS@HE2
```

check visually active site

# Chimera preparation

4. Open Fasta and PDB in **Chimera**
  - e. Save protein only (plus ions, metals) and ligand only in *pdb* formats separately

*Select -> Residue -> Ligand\_id*

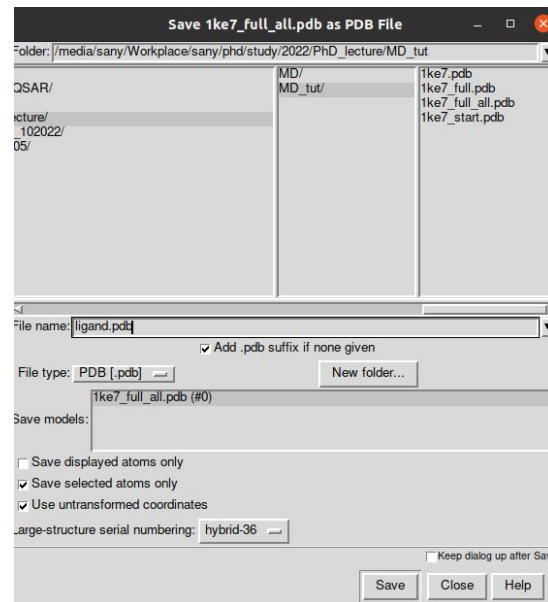

*File -> Save PDB -> Save selected only*

*ligand.pdb*

*Select -> Invert (all models)*

*File -> Save PDB -> Save selected only*

*protein\_HIS.pdb*

# Protein / Ligand preparation

Input Files for MD:

## ***protein\_HIS.pdb***

- *no missing non-terminal atoms/residues*
- *removed non-protein residues*
- *added all hydrogens*
- *set HID/HIE/HIP states*

## ***ligand.mol***

- *correct tautomerization*
- *protonated at 7.4 pH / 3d-based protonation (e.g. Chimera) / or user manual protonation*
- *added all hydrogens*

# Ligand preparation

6. Transform pdb of ligand into mol format (add bonds information from smiles)

Script <https://github.com/ci-lab-cz/md-scripts/blob/master/scripts/pdb2mol.py>

Run in Bash/Shell:

```
python md-scripts/scripts/pdb2mol.py -i ligand.pdb --smiles ligand.smi
```

# Ligand preparation

5. Save protonated smiles (pH 7.4) by Marvin into *ligand\_74.smi*

*Open Marvin Sketch*

*File -> Open -> ligand.smi*

*Calculations -> Protonation -> Major Microspecies -> 7.4 -> Ctrl+L (copy as Smiles)*

*Save to ligand\_74.smi*

# Theory: molecular interactions

In molecular dynamics (MD), force fields are mathematical models that describe the potential energy of a molecular system as a function of the spatial coordinates of its atoms.

All atoms see each other through space  
 $\sim \frac{1}{2} N(N-1)$  interactions

The force fields **define the interactions between atoms and molecules, providing a representation of the forces acting on particles within a simulation.**

The computational bottleneck

# Theory: force fields

**All force fields were developed using different experimental data and for slightly different purposes**

The most popular FFs for protein and protein-ligand simulations are:

**CHARMM** – proteins, lipids, nucleic acids

**AMBER** – peptide, protein, nucleic acids, lipid14, GAFF

**OPLS** - optimized to fit experimental properties of liquids, such as density and heat of vaporization

**GROMOS** – proteins, small molecules, also optimized for experimental parameters

**Each FF works with a particular set of simulation parameters therefore not all of them can be mixed**

# Practice: force fields

Prepare the protein topology with pdb2gmx

```
gmx pdb2gmx
```

## Synopsis

```
gmx pdb2gmx [-f [<.gro/.g96/...>]] [-o [<.gro/.g96/...>]] [-p [<.top>]]  
[-i [<.itp>]] [-n [<.ndx>]] [-q [<.gro/.g96/...>]]  
[-chainsep <enum>] [-merge <enum>] [-ff <string>]  
[-water <enum>] [-[no]inter] [-[no]ss] [-[no]ter]  
[-[no]lys] [-[no]arg] [-[no]asp] [-[no]glu] [-[no]gln]  
[-[no]his] [-angle <real>] [-dist <real>] [-[no]una]  
[-[no]ignh] [-[no]missing] [-[no]v] [-posrefc <real>]  
[-vsite <enum>] [-[no]heavyh] [-[no]deuterate]  
[-[no]chargegrp] [-[no]cmap] [-[no]renum] [-[no]rtpres]
```

## Description

`gmx pdb2gmx` reads a `.pdb` (or `.gro`) file, reads some database files, adds hydrogens to the molecules and generates coordinates in GROMACS (GROMOS), or optionally `.pdb`, format and a topology in GROMACS format. These files can subsequently be processed to generate a run input file.

```
gmx pdb2gmx -f protein.pdb -o protein.gro -water tip3p -ignh <<< "AMBER99SB-ILDN"
```

### New files:

**protein.gro:** a molecular structure in Gromos87 format.  
**topol.top:** molecular topology  
**posre.itp:** position restraints

# Practice: force fields

Prepare the protein topology with pdb2gmx

```
gmx pdb2gmx
```

## Synopsis

```
gmx pdb2gmx [-f [<.gro/.g96/...>]] [-o [<.gro/.g96/...>]] [-p [<.top>]]  
[-i [<.itp>]] [-n [<.ndx>]] [-q [<.gro/.g96/...>]]  
[-chainsep <enum>] [-merge <enum>] [-ff <string>]  
[-water <enum>] [-[no]inter] [-[no]ss] [-[no]ter]

[-vsite <enum>] [-[no]heavyh] [-[no]deuterate]  
[-[no]chargegrp] [-[no]cmap] [-[no]renum] [-[no]rtpres]
```

**pdb2gmx does not work on ligand**

## Description

`gmx pdb2gmx` reads a `.pdb` (or `.gro`) file, reads some database files, adds hydrogens to the molecules and generates coordinates in GROMACS (GROMOS), or optionally `.pdb`, format and a topology in GROMACS format. These files can subsequently be processed to generate a run input file.

```
gmx pdb2gmx -f protein.pdb -o protein.gro -water tip3p -ignh <<< "AMBER99SB-ILDN"
```

# Automation tools for ligand topology

AMBER	<a href="#"><u>Antechamber</u></a> <a href="#"><u>acpype</u></a>	Parametrizes molecules using GAFF A Python interface to Antechamber, writes GROMACS topologies
CHARMM	<a href="#"><u>CGenFF</u></a>	The official CHARMM General Force Field server
GROMOS87/ GROMOS96	<a href="#"><u>PRODRG 2.5</u></a> <a href="#"><u>ATB</u></a>	An automated server for topology generation A newer server for topology generation, uses GROMOS96 54A7
OPLS-AA	<a href="#"><u>Topolbuild</u></a> <a href="#"><u>TopolGen</u></a> <a href="#"><u>LigParGen</u></a>	Converts a Tripos .mol2 file into a topology A Perl script to convert an all-atom .pdb file to a topology A server from the Jorgensen group to produce OPLS topologies

# Ligand Force fields

Prepare the ligand topology using external tools

```
antechamber -i ligand.pdb -fi pdb -o lig.mol2 -fo mol2 -c bcc -pf y -s 2  
parmchk2 -i lig.mol2 -f mol2 -o lig.frcmod  
python pmed_amb2gmx.py -p lig.prmtop -x lig.inpcrd -o UNL
```

Build the topology for the protein-ligand system

Insert a line that says `#include lig.itp`" into `topol.top` after the position restraint file is included

Make adjustments is in the `[ molecules ]` directive

## New files:

*lig.mol2* - file of ligand with charges and bonds

*lig.frcmod* - Parameter modification file

*posre\_ligand.itp* - positional restraints

*ligand.gro* - ligand in Gromos87 format

*ligand.inpcrd* - Amber coordinate file of ligand

*ligand.prmtop* - Amber topology file

*ligand.top* - Gromacs topology file

Changed files: **topol.top**

# Solvation

To perform simulation we should add water molecules to mimic real environment.

There are two steps to defining the box and filling it with solvent:

- 1) Define the box dimensions using the editconf module
- 2) Fill the box with water using the solvate module.

We will use a simple cubic box as the unit cell.

First define the box using editconf:

```
gmx editconf -f protein.gro -o protein_newbox.gro -c -d 1.0 -bt cubic
```

*a solute-box distance of 1.0 nm will mean that there are at least 2.0 nm between any two periodic images of a protein. This distance should be sufficient for just about any cutoff scheme commonly used in simulations.*

**New files:**

**protein\_newbox.gro:** protein+box system

# Solvation

To perform simulation we should add water molecules to mimic real environment.

On the previous step we have defined a box, then we should fill it with solvent (water). Solvation is accomplished using solvate command:

```
gmx solvate -cp protein_newbox.gro -cs spc216.gro -o protein_solv.gro -p topol.top
```

-cp - the configuration of the protein (-cp)

-cs - the configuration of the solvent (-cs)

spc216.gro is a generic equilibrated 3-point solvent model (suitable for SPC, SPC/E, or TIP3P water, since they are all three-point water models)

## **New files:**

*protein\_solv.gro: protein + solvent system*

## **Changed files:**

**topol.top**

# Adding ions

We need to add ions of CL- or NA+ to neutralize our protein:

```
gmx grompp -f ions.mdp -c protein_solv.gro -p topol.top -o ions.tpr
```

```
gmx genion -s ions.tpr -o protein_solv_ions.gro -p topol.top -pname NA -nname CL -neutral
```

## New files:

**protein\_solv\_ions.gro:** protein + solvent + ions system

**ions.tpr:** portable binary run input file. This file contains the starting structure, the molecular topology and all the simulation parameters.

Changed files: **topol.top**

Solvated protein with ions

# Energy minimization

Before we can begin dynamics, we must ensure that the system has no steric clashes or inappropriate geometry (equilibrium state). **The structure is relaxed through a process called energy minimization (EM).**

## Prepare files:

```
gmx grompp -f minim.mdp -c protein_solv_ions.gro -p topol.top -o em.tpr
```

## Run the minimization:

```
gmx mdrun -v -deffnm em -s em.tpr
```

### New files:

*em.log: ASCII-text log file of the EM process*

*em.edr: Binary energy file*

*em.tpr: Contains the starting structure, the molecular topology and all the simulation parameters.*

*em.trr: Binary full-precision trajectory*

*em.gro: Energy-minimized structure*

# Energy minimization

## How to do an analysis:

The em.edr file contains all of the energy terms that GROMACS collects during EM. You can analyze any .edr file using the GROMACS energy module:

```
gmx energy -f em.edr -o potential.xvg << "Potential"
```

- **Epot** should be negative, and (for a simple protein in water) on the order of  $10^5$ - $10^6$ ,
- **maximum force, Fmax**, "emtol = 1000.0" should be no greater than target 1000 kJ mol<sup>-1</sup> nm<sup>-1</sup>.

# Equilibration

*Energy Minimization* ensured that we have a reasonable starting structure, but to begin real dynamics, we must equilibrate the solvent and ions around the protein.

# Why do we need equilibration?

**If we were to attempt unrestrained dynamics at this point, the system may collapse.**

The reason is that the solvent is mostly optimized within itself, and not necessarily with the solute. It needs to be brought to the temperature we wish to simulate and establish the proper orientation around the solute (the protein). After we achieved the correct temperature (based on kinetic energies), we will apply pressure to the system until it reaches the proper density.

# Controlling the system

Thermodynamic system has a number of state variables which describe its **macroscopic** state such as

- Particle number, volume, temperature, pressure, total energy

They are not all independent, but connected by equations of state

Example: Ideal gas of non-interacting point particles

$$p = p(V, T)$$
$$E = E(V, T)$$

$$p \cdot V = N \cdot k_B \cdot T$$
$$p = \rho k_B T$$
$$E = \frac{3}{2} N k_B T$$

# Restrain the system

To equilibrate the solvent and ions around the protein we need to apply position restraints on the heavy atoms of the protein.

The purpose of **posre.itp** is to apply a position restraining force on the heavy atoms of the protein (anything that is not a hydrogen). Movement is permitted, but only after overcoming a substantial energy penalty.

# NVT equilibration

## Canonical ensemble (NVT)

- Particle number N
- Volume V
- Temperature T

} External parameters

- Total energy E
- Pressure P

} Observables to be calculated

**In MD simulation:** some state variables are external parameters, others are observables to be calculated

Requires a **thermostat**, an algorithm that adds and removes energy to keep the temperature constant

- Velocity rescaling based on equipartition theorem

$$\langle \bar{E}_{kin} \rangle = \frac{1}{2} \sum_i m_i \langle \vec{v}_i^2 \rangle = \frac{3}{2} N k_B T$$

- Berendsen thermostat, Anderson thermostat

# NVT equilibration

## to run NVT equilibration:

```
gmx grompp -f nvt.mdp -c em.gro -r em.gro -p topol.top -o nvt.tpr
```

```
gmx mdrun -deffnm nvt -s nvt.tpr
```

## An analysis:

```
gmx energy -f nvt.edr -o temperature.xvg <<< "Temperature"
```

### New files:

*nvt.log*: ASCII-text log file of the equilibration process

*nvt.edr*: Binary energy file

*nvt.trr*: Binary full-precision trajectory

*nvt.gro*: NVT-minimized structure

# NPT equilibration

## Isothermal–isobaric ensemble (NPT)

- Particle number  $N$
  - Pressure  $P$
  - Temperature  $T$
- } External parameters
- Total energy  $E$
  - Volume  $V$
- } Observables to be calculated

Requires a **barostat** in addition to the thermostat, an algorithm that changes volume to keep the pressure constant

# NPT equilibration

Note that we are now including the `-t` flag to include the checkpoint file from the NVT equilibration

The coordinate file (`-c`) is the final output of the NVT simulation.

## to run NPT equilibration:

```
gmx grompp -f npt.mdp -c nvt.gro -r nvt.gro -t nvt.cpt -p topol.top -o npt.tpr gmx mdrun -deffnm npt -s npt.tpr
```

## An analysis:

```
gmx energy -f npt.edr -o pressure.xvg <<< "Pressure"
```

```
gmx energy -f npt.edr -o density.xvg <<< "Density"
```

## New files:

*nvt.log*: ASCII-text log file of the equilibration process

*nvt.edr*: Binary energy file

*nvt.trr*: Binary full-precision trajectory

*nvt.gro*: NVT-minimized structure

# NPT equilibration

# Periodic Boundary Conditions

Required  
(no atom sees another one twice):

$$L > 2R_c \quad R_c < \frac{1}{2}L$$

Preferred  
(protein does not see a copy of itself)

$$L > R_c + R_{mol} \quad R_c < L - R_{mol}$$

Even better  
(no solvent sees two proteins)

$$L > 2R_c + R_{mol} \quad R_c < \frac{1}{2}(L - R_{mol})$$

• Cubic:

Rectangular:

To simulate an infinite system, **periodic boundary conditions** are often applied. This allows atoms that leave one side of the simulation box to re-enter on the opposite side.

- PBCs are often used in computer simulations and mathematical models.
- The topology of two-dimensional PBC is equal to that of a world map of some video games; the geometry of the unit cell satisfies perfect two-dimensional tiling, and when an object passes through one side of the unit cell, it reappears on the opposite side with the same velocity.

# Production MD

the system is now well-equilibrated at the desired temperature and pressure. We are now ready to release the position restraints and run production MD

## We will run MD simulation

```
gmx grompp -f md.mdp -c npt.gro -t npt.cpt -p topol.top -o md_0_1.tpr
```

```
gmx mdrun -deffnm md_0_1 -s md_0_1.tpr
```

### New files:

**md\_0\_1.tpr:** portable binary run input file. It contains the starting structure of the simulation, the molecular topology and all the simulation parameters.

**md\_0\_1.log:** ASCII-text log file of the equilibration process

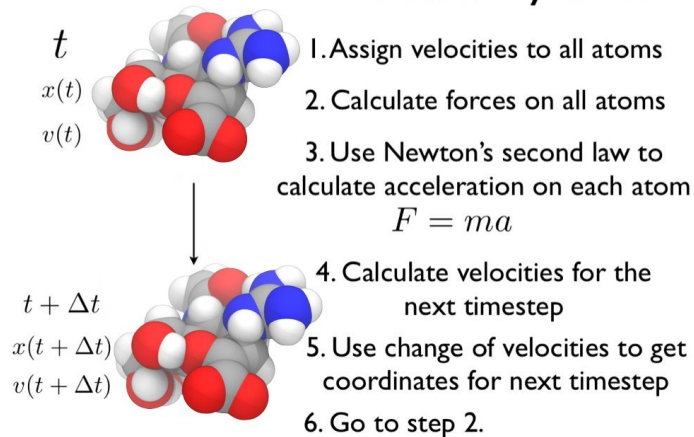

**md\_0\_1.cpt:** portable checkpoint file. The complete state of the simulation is stored in the checkpoint file, including extended thermostat/barostat variables, random number states and NMR time averaged data

**md\_0\_1.edr:** Binary energy file

**md\_0\_1.xtc:** Binary full-precision trajectory

**md\_0\_1.gro:** starting structure of the simulation in

## Molecular Dynamics

# Analysis of calculated MD simulation

## Remove PBC:

```
gmx trjconv -s md_out.tpr -f md_out.xtc -pbc nojump -o md_out_noj_noPBC.xtc <<<  
"System"
```

## Center system:

```
gmx trjconv -s md_out.tpr -f md_out_noj_noPBC.xtc -o md_centermolsnoPBC.xtc -pbc mol  
-center -n index.ndx <<< "Protein_UNL System"
```

## Alignment of all frames (Remove rotations and translations):

```
gmx trjconv -s md_out.tpr -f md_centermolsnoPBC.xtc -fit rot+trans -o md_fit.xtc -n index.ndx  
<<< "Protein_UNL System"
```

# Metrics

## 1) Root-mean-square deviation (RMSD):

the RMSD is a measure of the difference between a initial conformation of the ligand/protein conformation and the analysed conformation

### Root mean square deviations in structure

`gmx rms`, `gmx rmsdist`

The *root mean square deviation (RMSD)* of certain atoms in a molecule with respect to a reference structure can be calculated with the program `gmx rms` by least-square fitting the structure to the reference structure ( $t_2 = 0$ ) and subsequently calculating the *RMSD* ((458)).

$$RMSD(t_1, t_2) = \left[ \frac{1}{M} \sum_{i=1}^N m_i \|\mathbf{r}_i(t_1) - \mathbf{r}_i(t_2)\|^2 \right]^{\frac{1}{2}} \quad (458)$$

where  $M = \sum_{i=1}^N m_i$  and  $\mathbf{r}_i(t)$  is the position of atom  $i$  at time  $t$ . **Note** that fitting does not have to use the same atoms as the calculation of the *RMSD*; e.g. a protein is usually fitted on the backbone atoms (N, C $_{\alpha}$ , C), but the *RMSD* can be computed of the backbone or of the whole protein.

Instead of comparing the structures to the initial structure at time  $t = 0$  (so for example a crystal structure), one can also calculate (458) with a structure at time  $t_2 = t_1 - \tau$ . This gives some insight in the mobility as a function of  $\tau$ . A matrix can also be made with the *RMSD* as a function of  $t_1$  and  $t_2$ , which gives a nice graphical interpretation of a trajectory. If there are transitions in a trajectory, they will clearly show up in such a matrix.

Alternatively the *RMSD* can be computed using a fit-free method with the program `gmx rmsdist`:

$$RMSD(t) = \left[ \frac{1}{N^2} \sum_{i=1}^N \sum_{j=1}^N \|\mathbf{r}_{ij}(t) - \mathbf{r}_{ij}(0)\|^2 \right]^{\frac{1}{2}} \quad (459)$$

where the *distance*  $\mathbf{r}_{ij}$  between atoms at time  $t$  is compared with the distance between the same atoms at time 0.

To have a rough measure for the compactness of a structure, you can calculate the *radius of gyration* with the program `gmx gyrate` as follows:

$$R_g = \left( \frac{\sum_i \|\mathbf{r}_i\|^2 m_i}{\sum_i m_i} \right)^{\frac{1}{2}} \quad (456)$$

where  $m_i$  is the mass of atom  $i$  and  $\mathbf{r}_i$  the position of atom  $i$  with respect to the center of mass of the molecule. It is especially useful to characterize polymer solutions and proteins. The program will also provide the radius of gyration around the coordinate axis (or, optionally, principal axes) by only summing the radii components orthogonal to each axis, for instance

$$R_{g,x} = \left( \frac{\sum_i (r_{iy}^2 + r_{iz}^2) m_i}{\sum_i m_i} \right)^{\frac{1}{2}} \quad (457)$$

## Radius of gyration (total and around axes)

Conformer at the 1st ps  
Conformer at the 1000th ps

Value of Rgyr:  
Decreasing - compression  
Increasing - extension

## Root mean square fluctuation (RMSF, i.e. standard deviation)

`gmx rmsf` computes the root mean square fluctuation (RMSF, i.e. standard deviation) of atomic positions in the trajectory (supplied with `-f`) after (optionally) fitting to a reference frame (supplied with `-s`).

## Check your own MD trajectory

*frame.pdb* - a frame from the trajectory to provide topology  
*md\_fit.xtc* - your fitted MD trajectory

## MD simulation by one command:

### Output files:

**md\_out.tpr:** portable binary run input file. It contains the starting structure of the simulation, the molecular topology and all the simulation parameters.

**md\_out.log:** ASCII-text log file of the equilibration process

**md\_out.cpt:** portable checkpoint file. The complete state of the simulation is stored in the checkpoint file, including extended thermostat/barostat variables, random number states and NMR time averaged data

**md\_out.edr:** Binary energy file

**md\_out.xtc:** Binary full-precision trajectory

**md\_out.gro:** starting structure of the simulation

**md\_fit.xtc:** fitted trajectory (removed PBC and the rotation and translation, centered) to use for rmsd and energy calculation analysis

**md\_short\_forcheck.xtc:** fitted short trajectory (each 100 step is skipped)

**frame.pdb:** a frame from the trajectory to provide topology

### MD trajectory analysis files:

**rmsd.png** - rmsd of Backbone of protein

**rmsd\_ligand\_1.png** - rmsd of the heavy atoms of ligand

**gyrate.png** - radius of gyration of the protein

**rmsf.png** - root mean square fluctuation of each amino acids

# MMPBSA / MMGBSA

End-state free energy calculations  
with GROMACS files

# What can be done by MD

- to estimate binding affinity of protein-ligand complexes
  - Molecular mechanics Poisson–Boltzmann surface area (**MM/PBSA**)
  - Molecular mechanics generalized Born surface area (**MM/GBSA**)

In the MM/PBSA or MM/GBSA approach, the free energy for binding of the ligand (L) to the protein receptor (R) to form the complex (RL),

$$\Delta G_{bind} = G_{RL} - G_R - G_L \quad (4)$$

can be decomposed into contributions of different interactions and expressed as (58)

$$\Delta G_{bind} = \Delta H - T\Delta S = \Delta E_{MM} + \Delta G_{sol} - T\Delta S \quad (5)$$

in which

$$\Delta E_{MM} = \Delta E_{int} + \Delta E_{ele} + \Delta E_{vdW} \quad (6)$$

$$\Delta G_{sol} = \Delta G_{PB/GB} + \Delta G_{SA} \quad (7)$$

$$\Delta G_{SA} = \gamma \cdot SASA + b \quad (8)$$

# What can be done by MD

- to estimate binding affinity of protein-ligand complexes

In the MM/PBSA or MM/GBSA approach, the free energy for binding of the ligand (L) to the protein receptor (R) to form the complex (RL),

$$\Delta G_{\text{bind}} = G_{\text{RL}} - G_{\text{R}} - G_{\text{L}} \quad (4)$$

can be decomposed into contributions of different interactions and expressed as (58)

$$\Delta G_{\text{bind}} = \Delta H - T\Delta S = \Delta E_{\text{MM}} + \Delta G_{\text{sol}} - T\Delta S \quad (5)$$

$$\Delta E_{\text{MM}} = \Delta E_{\text{int}} + \Delta E_{\text{ele}} + \Delta E_{\text{vdW}} \quad (6)$$

$$\Delta G_{\text{sol}} = \Delta G_{\text{PB/GB}} + \Delta G_{\text{SA}} \quad (7)$$

$$\Delta G_{\text{SA}} = \gamma \cdot \text{SASA} + b \quad (8)$$

Total  $G_{\text{Binding}} =$

- Gas-phase molecular mechanics energy  $\Delta E_{\text{MM}}$ :**

- changes in the **internal energies  $\Delta E_{\text{int}}$**  (bond, angle, and dihedral energies)
- electrostatic energies  $\Delta E_{\text{ele}}$**
- van der Waals energies  $\Delta E_{\text{vdW}}$**

- sum of the electrostatic solvation energy  $G_{\text{sol}}$**

- The **polar contribution** is calculated using either the PB or GB model ( $\Delta G_{\text{PB/GB}}$ ). Where the GB method gives an analytical expression for the polar solvation energy and is thus much faster than the PB method.
- nonpolar energy** is usually estimated using the solvent-accessible surface area (**SASA**)

- The change in **conformational entropy  $-T\Delta S$**

- is usually calculated by normal-mode analysis (or Interaction entropy) on a set of conformational snapshots taken from MD simulations.

In which

## MMPBSA.in

Sample input file for PB/GB calculation

#This input file is meant to show only that gmx\_MMPBSA works. Although, we tried to use the input files as recommended in the

#Amber manual, some parameters have been changed to perform more expensive calculations in a reasonable amount of time. Feel free to change the parameters

#according to what is better for your system.
